Plaintiff citizen sued defendant city for negligence in causing plaintiff to contract typhoid fever. Defendant's water supply was derived from the severely polluted Hudson River. The water was purified, and pumped under the Erie Canal to the city. The pipe running under the canal, made of thin metal and encased in concrete, rusted through, and waters of the canal, as well as untreated Hudson River water which had overflowed into the canal, passed into the water supply. Defendant had notice of the defective pipe, but failed to notify its citizens that the municipal water was polluted. An epidemic of typhoid broke out. Plaintiff asserted that defendant was liable for his illness by neglecting to repair the pipe or notify its citizens. The Supreme Court of New York noted that plaintiff must show that the typhoid originated in water polluted through defendant's negligence. However, this could be satisfactorily accomplished by showing that bacilli were introduced into plaintiff's system through municipal water, allowing the jury to infer defendant's liability. Determining that the evidence amply supported the jury verdict for plaintiff, the court held defendant liable. (Hart-Florida)

IN RE WATERFRONT OF CITY OF NEW YORK (RIPARIAN RIGHTS SUBJECT TO PUBLIC RIGHT TO IMPROVE NAVIGATION).
231 App Div 597, 248 NYS 190-191 (1931).

Descriptors: *New York, *Riparian rights, *Eminent domain, *Navigation, Navigable waters, Riparian land, Riparian waters, State governments, Cities, Public rights, Piers, Access routes, Roads, Legal aspects, Judicial decisions.

In a city's proceedings to condemn certain riparian lands and riparian rights for navigational purposes, the Supreme Court of New York noted that riparian owners are not entitled to damages for the destruction of piers or the loss of their access to the water. Such rights and privileges are subject to the state's right to make improvements for the benefit of navigation. (Liptak-Florida)

REORGANIZATION PLAN NO. 3 OF 1970 (ENVIRONMENTAL PROTECTION AGENCY).

Hearings. Subcomm of the Comm on Gov't Operations, US House of Representatives, 91st Congress,

2nd Session, July 22, 23, Aug 4, 1970. 209 p, 2 tab, 2 chart, 1 append.

Descriptors: *Adminstrative agencies, *Federal government, *Environment, *Legislation, Ecology, Water pollution, Pollution abatement, Water pollution control, Water quality, Standards, Water pollution effects, Air pollution, Air pollution effects, Pesticides, Research and development, Costs, Coordination, Administration, Management, Planning, Water policy, Public health, Solid wastes, Effluents, Supervisory control (Power).

These hearings before a House subcommittee on government reorganization concerned President Nixon's proposal to create the Environmental Protection Agency (EPA). The President's message to Congress, which also contained a proposed National Oceanic and Atmospheric Administration, outlined the need, functions and organization of the EPA. The EPA would make possible a coordinated attack on water, air, and land pollution. It would undertake functions of many overlapping agencies including: (1) the Federal Water Quality Administration, (2) the National Air Pollution Control Administration, (3) the Bureau of Solid Waste Management, (4) the Bureau of Water Hygiene, and (5) various other agencies concerned with pesticides. Principal functions of the EPA would include: (1) establishment and enforcement of environmental protection standards consistent with national environmental goals, (2) research and data collection on pollution effects and control, (3) assisting other organizations through grants and technical assistance, and (4) assisting the Council on Environmental Quality in developing and recommending policies for environmental protection. Questions from the subcommittee centered on: (1) the need for the EPA, (2) its operation, (3) its effect on other agencies, and (4) inclusion or exclusion of various pollution problems from the agency's activities. (See also W71-04326). (Duss-Florida)

REORGANIZATION PLANS NOS. 3 AND 4 OF 1970.
Hearings, Subcomm on Executive Reorganization and Government Research, Comm on Government Operations, US Senate, 91st Congress, 2nd Session, July 28, 29, Sept 1, 1970. 217 p, 1 tab.

Descriptors: *Administrative agencies, *Federal government, *Environment, *Oceans, Ecology, Water pollution, Pollution abatement, Air pollution, Research and development, Coordination, Administration, Water resources development, Marine fisheries, Commercial fish, Water policy, Standards, Environmental effects, Weather, Atmosphere, Water quality, Public health, Effluents, Estuarine environment, Oceanography, Natural resources, Supervisory control (Power), Legislation.

These hearings before a Senate subcommittee of the Committee on Government Operations concerned President Nixon's proposal to create the Environmental Protection Agency (EPA) and the National Oceanic and Atmospheric Administration (NOAA). The EPA would bring together in a simple organization the major federal pollution control programs in: the Department of Interior; the Department of Health, Education and Welfare; the Atomic Energy Commission; and the interagency Council on Environmental Quality. The EPA's principal functions would be: (1) to establish and enforce environmental protection standards consistent with national environmental goals; (2) to research pollution problems; (3) to assist other organizations in pollution control; and (4) to develop and recommend environmental policies. Combat water pollution would be a major part of these functions. The NOAA would bring together within the Commerce Department the major federal programs dealing with the seas and atmosphere. The function of the NOAA would be to: (1) provide a national oceanic and atmospheric program of research and development; (2) provide assistance to other governmental agencies and private institutions; and (3) insure consideration of environmental protection in development of resources. Many witnesses questioned the method of organization and goals of the two agencies, particularly the NOAA's emphasis on resource development as opposed to environmental protection. RULES OF PRACTICE AND PROCEDURE.
Delaware River Basin Commission, Trenton, N.J.

Administrative Manual, Part 11, Revised to include Amendments through May 1, 1970. 27 p.

Descriptors: *Delware River Basin Commission, *Administration, *Administrative decisions, *Decision making, Project planning, Water resources development, River basin development, Programs, Water conservation, Non-structural alternatives, Structures, Regulation, Evaluation, Long-term planning, Short-term planning, Water policy, Pollution abatement, Water quality control, Water pollution control, River basin commissions, Interstate commissions, Delware, New Jersey, Administrative agencies, Adjudication procedure.

Part 11 of the Delware River Basin Commission's administrative manual, these regulations govern the procedure for including projects in the Comprehensive Plan and Water Resources Program. Article 1 defines the scope and concept of the six-year comprehensive plan and the procedure for including new projects and reviewing current projects. Article 2 governs the procedure for including projects in the annual Water Resources Programs. Article 3 covers: (1) classification and submission of projects for approval, (2) referral by state and federal agencies, (3) exhibits, (4) hearings, (5) objections, and (6) certification of approval. Objections to proposed projects may not be heard unless filed in detailed writing in advance of hearing. Article 4 prescribes the procedure for reviewing water quality cases. Article 5 governs: (1) the conduct of hearings, (2) timely requests, (3) joint hearings, (4) hearing schedules, (5) authority and power of hearing officers, (6) hearing procedure, (7) testimony, (8) evidentiary rules, (9) record of proceedings, (10) findings and reports, and (11) commission action. Article 6 contains definitions and general provisions as to construction of the preceding articles. (Liptak-Florida)

PEOPLE V TRUSTEES OF FREEHOLDERS (VALIDITY OF PRE-STATEHOOD PATENTS TO BEDS UNDER NAVIGABLE WATERS).
146 Misc 473, 261 NYS 598-605 (1932).

Descriptors: *New York, *Ownership of beds, *Navigable waters, *Land tenure, Boundaries (Property), Lakes, Bays, Beds, Boundary disputes, Real property, Cities, Local governments, State governments, Proprietary power, Leases, Rents, Legal aspects, Judicial decisions.
Identifiers: *Patents (Land), Indians.

Plaintiff state brought action against defendant town to establish title to the beds of various navigable waterbodies. Plaintiff contended that the beds belonged to the state by virtue of its sovereignty, that prior patents to the town were void for failure to acquire title from the Indians, and that prior decisions vesting title in the town were not binding since the state was not a party. The court held that, since it did not appear that the Indians ever had any title to the property in dispute, acquisition of title from the Indians was not a condition precedent to the validity of defendant's patents. The court also held that it was against public policy for the state to assert title in land over which the town had exercised control and from which the town had realized all the rent and profits for over 200 years. Noting that the state had no valid argument, the court said that the prior decisions should be considered controlling. The state's claim was dismissed. (Liptak-Florida)

BAUMHART V MCCLURE (OWNERSHIP RIPARIAN LAND AFTER SUSTAINED MERGENCE).

153 NE 211-212 (Ohio App 1926).

Descriptors: *Ohio, *Land tenure, *Accr (Legal aspects), *Boundaries (Property), Bou ry disputes, Real property, Erosion, Submerg Adjudication procedure, Riparian land, Lake Lakes, Judicial decisions, Legal aspects, Avuls

Plaintiff riparian lot owner sought to quiet ti riparian land claimed by defendant riparian o Defendant's lot was above Lake Erie when originally platted. It was later submerged f years, but had recently reappeared. Pla claimed title to the lot by accretion or reli The Ohio Court of Appeals defined accretion increase in realty by gradual deposit of material by water to create dry land. Relictio defined as an increase in realty by recessi water. Noting that the burden of proof was the claimant by accretion as against one h chain of title, the court stated that an owner' is destroyed by a disappearance of land only the land is transported beyond the owner's bo ry, or is submerged for a period precl establishment of the property's identity. Fu more, it was observed that title would n destroyed by sudden avulsion from storm. S that land lost by submergence might be regain reliction, and its disappearance by erosion co returned by accretion, the court held that pl had not sustained the burden of proving that d dant's title in the property had been perma destroyed by its submergence. Defendant's was held unimpaired. (Hart-Florida)

PEAL OF PHILADELPHIA FELT CO (CONMNATION VALUE OF RIPARIAN LAND).
A 208-209 (Pa 1928).

criptors: *Pennsylvania, *Condemnation value, droelectric plants, *Dams, Eminent domain, demnation, Parks, Rivers, Riparian rights, mpensation, State governments, Administrative ncies, Judicial decisions, Legal aspects, kwater, Recreation.

Plaintiff felt company appealed from an assessment of damages for property condemned for use as a public park. The backwater from plaintiff's downriver dam extended completely through the condemned tract. Plaintiff asserted that the condemnation affected its right to maintain its dam at the present height. The park commissioners contended that there was no intent to interfere with the right to maintain the dam and that such maintenance would not interfere with the park. Determining that park use of the property would not interfere with the dam, the Supreme Court of Pennsylvania held that the board of viewers had properly disallowed damages for interference with the water rights. (Hart-Florida)

STATE WATER CONTROL LAW.
Virginia State Water Control Board, Richmond.

June 1970. 21 p.

Descriptors: *Water quality control, *Virginia, *Water pollution control, Pollution abatement, Water conservation, Legislation, Legal aspects, Social aspects, Water resources development, Municipal wastes, Sewage, Regulation, Water quality, Discharge (Water), Sewage disposal, Waste disposal, Abatement, Taxes.

A compilation of statutes and regulations pertaining to the abatement and prevention of water pollution in Virginia, the Virginia Water Control Law is divided into seven articles encompassing: (1) general statutory provisions; (2) the structure, power and duties of the water control board; (3) regulation of industrial establishments; (4) regulation of sewage discharges; (5) enforcement and appeal procedures; (6) offenses and penalties; and (7) pollution from boats. Regulations and requirements dealing with various aspects of sewage discharge are established by the Virginia Water Control Board. Miscellaneous offenses concerning water pollution include: (1) casting garbage into waters; (2) obstructing or contaminating Virginia waters; (3) throwing trash into or obstructing rivers, creeks, streams, or swamps; and (4) discharge of oil in certain waters. An accelerated amortization rate is established on certain facilities designed to control pollution. (Powell-Florida)

OUTLINE -- ENFORCEMENT OF 1899 REFUSE ACT THROUGH CITIZEN ACTION.
Subcomm on Conservation and Natural Resources of the House Comm on Gov't Operations, 91st Cong, 2d Sess, 1970. 2 p.

Descriptors: *Pollution abatement, *Water pollution control, *Rivers and Harbors Act, *Remedies, Wastes, Water conservation, Legislation, Water resources development, Legal aspects, Social aspects, Water law, Navigable waters, Water pollution, Water policy, Water quality control, Administration, Federal government, Federal jurisdiction.
Identifiers: *Refuse Act of 1899.

The Conservation and Natural Resources Subcommittee of the Committee on Government Operations prepared this brief outline for distribution to citizens interested in preventing pollution and enhancing the quality of United States' waters through citizen action aiding enforcement of the 1899 Refuse Act. The outline is divided into five parts. The first portion of the outline deals with what is prohibited by the Act. This section also defines the term 'refuse'. The second part of the outline covers the authorization and issuance of permits to discharge material into navigable waters. Part three of the outline lists the penalties for violation of the Act. The fourth portion of the material deals with the procedure by which citizens may seek enforcement of the Refuse Act. This portion enumerates the information which should be provided to the United State Attorney in a detailed, notarized statement. The final section of the outline discusses qui tam suits instituted by citizens where the government fails to prosecute a claim within a reasonable period of time. (Powell-Florida)

CHESAPEAKE BAY IN LEGAL PERSPECTIVE,
Maryland Univ., Baltimore. School of Law.
Garret ower.
Estuarine Pollution Study Series 1, Federal Water Pollution Control Administration, Mar 1970. 270 p, 1 tab, 646 ref. FWQA Contract 14-12-421.

Descriptors: *Maryland, *Virginia, *Estuaries, *Legal aspects, Interstate, Legislation, Estuarine environment, Navigable waters, Land tenure, Federal jurisdiction, Federal-state water rights conflicts, State jurisdiction, State governments, Beds, Riparian land, Riparian waters, Local governments, Interstate compacts, Political aspects, Water resources development, Water quality control, Dredging, Fish conservation, Coastal engineering, Judicial decisions.

The Chesapeake Bay is a major east coast interstate estuarine area which has many legal and management characteristics common to other estuarine areas of the United States. This report describes the historical development and resulting complex, interacting legal framework -- at the federal, state, local, and interstate levels -- which regulates development of the Bay's resources. Case studies are presented which relate this legal framework to specific estuarine management problems such as: (1) water quality, (2) withdrawals and diversions, (3) dredging, and (4) dumping. A proposed model statute is presented which may be of assistance to coastal states in improving the planning, development, management, and conservation of estuarine areas. The report is comprehensively referenced and written in a manner understandable to laymen as well as the legally or technically trained reader. (Earl-Florida)

TOWARDS A BETTER USE OF THE OCEAN; CONTEMPORARY LEGAL PROBLEMS IN OCEAN DEVELOPMENT,
Stockholm International Peace Research Inst. (Sweden).
W. T. Burke, R. Bierzanek, I. Brownlie, W. M. Chapman, and C. Girard.
New York, Humanities Press, 1969. 231 p, 2 tab, 263 ref, 4 append.

Descriptors: *International waters, *Law of the sea, *Continental Shelf, *Oceans, International law, Technology, Legal aspects, Marine fisheries, Foreign waters, Economic impact, Political constraints, Commercial fishing, Oceanography, Military aspects, Mineral industry, Boundary disputes, Institutional constraints, Foreign countries, Political aspects, Ownership of beds, Treaties, Research equipment, Buoys, Submarines, Judicial decisions.
Identifiers: *Ocean resources.

The main article of this symposium, a study of contemporary legal problems in ocean development, considers the burdens placed upon existing, international law by technological advances in ocean exploitation. Conflicts arising in specific areas of ocean use are identified, and the legal policy questions within each area are examined. Areas of conflict discussed include: (1) the acquisition of mineral resources, (2) acquisition and control of marine fishery resources, (3) military uses of the continental shelf and the seabed beyond, and (4) scientific research in the oceans. The consequences of claims to special rights by adjacent coastal states and the accelerating trend towards such claims are evaluated. The study also considers possible modes of regulating international fisheries and the exploitation of marine mineral resources. Varying alternatives for accomodating or restricting military use of the oceanic environment are suggested. Finally, the study examines the need for institutional innovations and international accords to protect instruments of scientific research, such as buoys and submersibles, from the restrictions

created by expanded boundary claims. In each area of conflict, the author sets forth appraisals and recommendations. Following the author's study are evaluatory comments and recommendations by seven international scholars. (Earl-Florida)

WATER-USE LAW IN MISSOURI,
Missouri Agricultural Experiment Station, Columbia.
Fred L. Mann, James McLarney, Robert D. Angle, and Frank Miller.
Research Bulletin 889, October 1965. 68 p, 334 ref.

Descriptors: *Missouri, *Water law, *Water utilization, *Riparian rights, Water management (Applied), Administration, Legal aspects, Water rights, Water policy, Judicial decisions, Legislation, Prior appropriation, Preferences (Water rights), Regulation, Surface waters, Streams, Watercourses (Legal), Groundwater, Hydrologic cycle, Riparian waters, Riparian land, Natural flow doctrine, Reasonable use.

Although the legislature has provided regulation of certain water-use aspects, the use of water in Missouri is governed primarily by court decisions applying common law rules. Riparian waters are those waters confined within the banks of a natural watercourse or lake, to which use and access rights attach. The Missouri courts have refused to follow a strict definition of a watercourse. Surveyed is the Missouri case law distinguishing surface waters, overflow waters, water in artificial watercourses, and subterranean waters from riparian waters. Missouri courts have adopted the doctrine of riparian rights but are not committed to either the natural flow or reasonable use theory. Riparian rights may be acquired by prescription in Missouri. Missouri case law concerning alteration of quantity and quality of water flow, flooding, artificial watercourses, navigable waters, ownership of beds, and state jurisdiction over watercourses is examined. With respect to subterranean waters, no Missouri case defines or states a position on percolating water. (Powell-Florida)

RAGAN V SUSQUEHANNA POWER CO (DAMAGES FOR FAILURE TO RELOCATE ROAD FLOODED BY DAM BACKWATER).
146 A 758-760 (Ct App Md 1929).

Descriptors: *Maryland, *Dams, *Roads, *Backwater, Flooding, Bridges, Hydroelectric plants, Maximum probable flood, Design flood, Overflow, Administrative agencies, Administrative decisions, State governments, Eminent domain, Condemnation, Damages.

Plaintiff landowner sued defendant power company for damages caused by defendant's failure to construct a new road to replace one overflowed by the backwater from defendant's dam. The flooding caused plaintiff's route to his property to be longer, which plaintiff alleged reduced the property's value. Defendant had agreed with the county commissioners to relocate public roads and bridges which were flooded. Plaintiff asserted that defendant and the commissioners had conspired to designate the road as private, relieving defendant of a duty to reconstruct it. The Court of Appeals of Maryland observed that the agreement did not require relocation upon new roadbeds. Since plaintiff did have access to his property, the court held that the agreement was not breached and that defendant was not liable. The court furthermore held that plaintiff had failed to prove a conspiracy to defraud. Since mere inconvenience did not constitute a taking, the court held that plaintiff's property had not been condemned. (Hart-Florida)
W71-04340

HALEY V DAVENPORT (CONSTITUTIONALITY OF STATUTE AUTHORIZING TRESPASS TO DRAIN SWAMPS AND PONDS).
168 A 102-103 (Me 1933).

Descriptors: *Maine, *Legislation, *Streams, *Eminent domain, Condemnation, Damages, Ponds, Diatomaceous earth, Dredging, Legal aspects, Judicial decisions, Drainage, Channels.
Identifiers: *Constitutionality.

Plaintiff riparian landowner sued defendant landowner for trespass. Defendant wished to drain a pond upon his land to extract valuable diatomaceous earth and entered plaintiff's land to deepen the stream which drained the pond, under a statute permitting landowners to enter adjacent lands to drain such ponds. Plaintiff contended that the statute unconstitutionally permitted condemnation of private lands for private use. Determining that defendant had unquestionably taken plaintiff's land for his personal benefit under authority of the statute, the Supreme Judicial Court of Maine held the statute unconstitutional and held defendant liable for trespass. The Court noted that appropriation of property for a purpose of great benefit to the public is not for that reason a taking for a public use. (Hart-Florida)
W71-04341

PEOPLE EX REL WESTERN NEW YORK AND P RY V STATE TAX COMM'N (ASSESSMENT OF RAILROAD BRIDGE AS A SPECIAL FRANCHISE).

244 NY 596, 155 NE 911-912 (1927).

Descriptors: *New York, *Railroads, *Bridges, *Assessments, Taxes, Navigable rivers, Non-navigable waters, Beds, River beds, Ownership of beds, Riparian land, Riparian rights, Administrative agencies, Administrative decisions, Legislation, Compensation, Condemnation, Eminent domain, Judicial decisions, Legal aspects, Government finance.

Plaintiff railroad company brought action to prevent assessment of its bridges across a river as a special franchise. The river was non-navigable in its natural state. Accordingly, title to the beds and shores were alienated by the state. Plantiff purchased a right-of-way in these lands and erected a bridge. Legislation was later enacted declaring the river navigable. Defendant tax commission accordingly assessed plaintiff's bridge as a special franchise. The Court of Appeals of New York observed that the statute, as applied to plaintiff in these circumstances, amounted to a taking without compensation. Therefore, plaintiff's right to erect a bridge was held not to be a special franchise. (Hart-Florida)
W71-04342

GARDEN CLUB OF VIRGINIA V VIRGINIA PUBLIC SERVICE CO (JURISDICTION OF CORPORATION COMMISSION TO GRANT PERMIT FOR DAM ON NON—NAVIGABLE RIVER).
151 SE 161-165 (Sup Ct App Va 1930).

Descriptors: *Virginia, *Dams, *Design flood, *Administrative decisions, Dam construction, Flood control, Hydroelectric plants, Maximum probable flood, Ponding, Administrative agencies, Adjudication procedure, Judicial decisions, Legal aspects, Navigable rivers, Navigable waters, Non-navigable waters, Rivers, Interstate.
Identifiers: *Interstate commerce.

Plaintiff garden club contested defendant service company's petition to State Corporation Commission for erection of a dam on a non-navigable river. The application was opposed by another company whose plant would be flooded by the design flood. That company induced defendant to lower the dam height slightly to avoid flooding its plant. Since the river was non-navigable, the Commission had jurisdiction of the petition only if defendant's would affect interstate commerce. Defend original application was subject to the Cor sion's jurisdiction. With the lowered height, merce was not affected, and the Commissio nied jurisdiction of the petition. Plaintiff conte that defendant had no right to lower the dam h to divest the Commission of jurisdiction. Deter ing that the change was made for practical poses, rather than to deprive the Commission risdiction, the Supreme Court of Appeals of ginia held that the Commission properly dism the petition for lack of jurisdiction. (Hart-Flori

RE LANDS ON UPPER NEW YORK BAY ASEMENT IN SUBMERGED LANDS EXTINUISHED BY RESOLUTION OF MUNICIPAL OUNCIL).
5 App Div 438, 214 NYS 234-236 (Sup Ct 26).

scriptors: *New York, *Condemnation, *Beds der water, *Cities, Beds, Land tenure, Real proty, Ownership of beds, Easements, Roads, Railds, Eminent domain, Legal aspects, Judicial cisions.

intiff city sought to condemn lands under water ending from a street to the pierhead line. The preme Court of New York had formerly decided t since the street extended to the waters edge en the city charter took effect, the city had an ement in the submerged lands between the et lines as extended to the pierhead line. On rgument, it was pointed out that the submerged tion of the street had been closed by resolution a municipal council. Defendant transit company ued that whatever easement existed in the subrged land was extinguished by the resolution, could not have existed at the time of conmnation. Plaintiff argued that the conditions essary for closing the street had not been sfied, and that therefore the resolution did not nguish the easement. Presuming that the mupal resolution had satisfied the conditions for ing the street, the court held that the closing of street extinguished plaintiff's easement therein that there was no public easement in the lands demned. )PLE V ZORA REALTY CO (ATTEMPT TO CLARE PATENT IN SUBMERGED LANDS D FOR NONUSE).
Misc 523, 220 NYS 40-41 (Sup Ct 1926).

criptors: *New York, *Land tenure, *States, vnership of beds, Beds, Beds under water, eficial use, High water mark, Low water mark, rian land, Legal aspects, Judicial decisions.

ntiff state brought action to declare a patent of s between high and low water mark a nullity. endant owned the upland adjacent to the uted property. The patent, issued to defendant years previously, reserved to the people the to use the premises until the land was used for merce or the beneficial use of the patentee. No limit within which the land must have been zed was expressed in the patent. As defendant never utilized the land for any purpose, plaintontended that the delay was unreasonable, and sought to declare the patent void for nonuse. Holding that the conveyance was in fee, taking effect as to title, at the time of the conveyance, and as to enjoyment when utilized, the Supreme Court of New York granted defendant's motion to dismiss. (Hart-Florida)
W71-04348

IN RE INWOOD HILL PARK (CONDEMNATION OF CITY'S OWN LAND FOR PARK).
219 App Div 478, 220 NYS 298-305 (Sup Ct 1927).

Descriptors: *New York, *Condemnation, *Condemnation value, *Cities, Beds, Beds under water, Ownership of beds, Parks, Land use, Eminent domain, State governments, Legal aspects, Judicial decisions, Land tenure, Compensation, Recreation.

Plaintiff city sought to condemn its own land for a park. The lower court refused to allow an award for plaintiff's land. The submerged land was located between the high water mark and the federal bulkhead line. The Supreme Court of New York said that plaintiff could use its waterfront property for any public purpose and that since the state was empowered to dispose of submerged lands, it could permit plaintiff to do likewise. Holding that plaintiff might condemn the land and assess the award against the property, the court noted that the compensation should be the actual value of the condemned land. Furthermore the court held that a statute declaring plaintiff's rights in the property inalienable did not preclude condemnation. (Hart-Florida)
W71-04349

WHITE V STATE (VALIDITY OF GRANT OF SUBMERGED STATE LANDS).
239 So 2d 484-488 (La App 1970).

Descriptors: *Louisiana, *Ownership of beds, *Navigable waters, *State governments, Beds, Bays, Gulf of Mexico, Land tenure, Leases, Proprietary power, Boundaries (Property), Regulation, Public lands, Public rights, Administrative agencies, Legal aspects, Judicial decisions, Beds under water, Legislation.

Plaintiff landowner sued defendant state to regain possession of a portion of the bed of a navigable bay. Plaintiff based her title on a state transfer of the land to a levee district, a sheriff's sale ordered by the levee district, and two state patents confirming the sheriff's sale. Defendant had subsequently granted mineral leases in the property to an oil company. Defendant contended that the state transfers and patents were null and void because they violated state statutes prohibiting the sale of submerged sovereignty lands. Affirming a judgment for defendant, the Court of Appeal of Louisiana held the first transfer to the levee district void. Statute only authorized the transfer of land, not beds of navigable water. The sheriff's sale was declared void because the levee district had no authority to order the sale. The two state patents were void because they were in violation of a statutory prohibition against the sale or grant of submerged bottoms connected with the Gulf of Mexico. (Liptak-Florida)

NATURAL HAZARD IN HUMAN ECOLOGICAL PERSPECTIVE: HYPOTHESES AND MODELS,
Clark Univ., Worcester, Mass. Graduate School of Geography.
Robert W. Kates.
Working Paper No 14, Natural Hazard Research, 1970. 26 p, 5 fig, 14 ref.

Descriptors: *Model studies, *Hazards, Ecology, Computers, Simulation analysis, Management, Decision making, Drought, Water supply.
Identifiers: *Global hypotheses, Human adjustments, East Africa.

This paper was one in a series on research progress in the field of human adjustments to natural hazards. A rudimentary model of the short-run process of adjustment constituted the major focus of the study. The models sought to fashion major hypotheses of hazard behavior into structures capable of computer simulation. Under the global hypotheses of natural hazards such topics as man-nature interaction, techno-social stages, hazard differences, decision-maker differences, individual differences, perception of hazard, awareness of adjustments, and evaluation of adjustments were described. Specific qualities for a model useful for hazard research suggested were that it should be: parsimonious, conservative, flexible, useful, and aesthetically pleasing. The modeling of the ecological perspective within a general systems framework was shown as a single cross-section of space and time. The model contained a human use system and a natural events system which interacted to pose a natural hazard. This generated a set of hazard effects and led to a need for adjustment processes control by use of a managerial adjustment decision model or an aggregate adjustment decision model. The progress being made in modeling drought in East African smallholder agriculture was used as an illustration of the general model other specific hazards mentioned that the human use system could be related to were urban residential development, municipal water supply, etc. (Kriss-Cornell)

07. RESOURCES DATA

7A. Network Design

A PROPOSED STREAMFLOW DATA PROGRAM FOR NEW YORK,
Geological Survey, Albany, N.Y.
Kenneth I. Darmer.
Geological Survey Open-file report, 1970. 29 p, 5 fig, 8 tab.

Descriptors: *Streamflow, *Hydrologic data, *Project planning, *New York, Evaluation, Data collection, Gaging stations, Time series analysis, River basins, Network design, Data processing, Watershed management.
Identifiers: *Streamflow data program (N.Y.).

Available streamflow information for New York has been evaluated to provide guidelines for planning needed future programs of data collection and analysis. The evaluation followed three basic steps: (1) quantitative definition of long-term goals for streamflow information, (2) examination and analysis of available data to determine which goals have been attained, and (3) consideration of alternate programs and techniques to most efficiently reach the unattained goals. This evaluation indicates that available data are sufficient for attaining several goals and that significant changes are desirable in the present data-collection program. A future program is proposed for both data collection and data analyses to reach the unattained goals. A map, scale 16 mi per in, shows gaging stations in operation and proposed. Symbols indicate type of station, as for long-term trend, current purpose, and design and planning. (Lang-USGS)

A CONTRIBUTION TO THE PROBLEM OF SPACING RAINGAUGES IN RUGGED TERRAIN,
Otago Univ., Dunedin (New Zealand). Dept. of Geography.
Peter Hutchinson.
Journal of Hydrology, Vol 12, No 1, p 1-14, December 1970. 14 p, 6 fig, 2 tab, 11 ref.

Descriptors: *Network design, *Rain gages, *Distribution patterns, *Topography, Mountains, Statistical methods, Gaging stations, Data collections, Hydrologic data, Meteorological data, Stations.
Identifiers: *Rain gage networks, *New Zealand.

The areal variability of rainfall is affected by the nature of the terrain, and it is necessary to establish a greater network density in mountainous areas than in flat ones. This paper examines the possibility of establishing quantitative relationships between the 'local relief', used as a measure of the ruggedness of the terrain, and the required network density for given accuracies of estimates for mean catchment rainfall. This is done by comparing the variability of rainfall on three climatically similar areas. Two are in New Zealand, and one is a theoretically derived flat area which is subjected to a statistically similar rainfall regime. The areas chosen were a mountainous area, Coastal Otago, New Zealand, and a flat to rolling area, Coastal Canterbury, New Zealand. The intensity and distribution of 172 actual storms on the two real areas taken on a daily basis were thus mapped, and two parameters, the maximum daily intensity and mean diameter, were measured for each storm. (Knapp-USGS)

7B. Data Acquisition

MEASURING STREAM DISCHARGE USING THE DYE-DILUTION METHOD (CHEMICAL GAUGING),
New Zealand Forest Service, Wellington. Protection Forestry Branch.
Hans M. Keller.
New Zealand Ministry of Works, Water and Soil Division Miscellaneous Hydrological Publication No 2, 1969. 10 p, 1 fig, 2 tab, 5 ref, 3 append.

Descriptors: *Tracers, *Discharge measurement, *Tracking techniques, *Dye releases, Stream gages, Water measurement, Discharge (Water), Analytical techniques.
Identifiers: *Dye-dilution method.

Field and laboratory procedures are given for chemical gaging by the dye-dilution method, using sodium dichromate and a 2-gallon injection container. Injecting at a constant rate, the stream discharge is equal to the dilution ratio multiplied by the injection rate. Practical hints are given for the calibration of the injection rates, the preparation of the initial solution, the precautions to be taken in the field, and the acquisition of quick but accurate results in the laboratory. Forms for use in the field as well as for the analysis in the laboratory are proposed. With clean and careful handling of equipment and chemicals standard errors of about 2 1/2 percent should be obtained. In turbulent mountain streams and small rivers this method has been found suitable, inexpensive, and relatively quick. (Knapp-USGS)
W71-03930

USE OF PORE CASTS AND SCANNING ELECTRON MICROSCOPE TO STUDY PORE GEOMETRY,
Pan American Petroleum Corp., Tulsa, Okla. Research Center.
Edward D. Pittman, and Robert W. Duschatko.
Journal of Sedimentary Petrology, Vol 40, No 4, p 1153-1157, December 1970. 5 p, 2 fig, 15 ref.

Descriptors: *Porosity, *Electron microscopy, *Permeability, *Porous media, *Pores, Interstices, Aquifers, Analytical techniques, Laboratory tests, Percolation, Groundwater movement, Voids.
Identifiers: *Pore geometry.

Various types of pore casts, replicas of void space, useful for the study of pore geometry can be prepared from rocks impregnated with plastic. Conventional light microscopes are suitable for examination of most pore casts; however the scanning electron microscope is definitely superior and is essential for good photographic illustrations. Study of pore casts provides information on the distribution and shape of pores and interconnecting passageways that influence permeability and control the flow of fluids. (Knapp-USGS)

A MECHANICAL DEVICE FOR RELEASI FLUORESCENT TRACERS,
Geological Survey of India, Calcutta. Mari Geology Unit.
P. C. Shrivastava.
Marine Geology, Vol 9, No 5, p M43-M4 December 1970. 4 p, 2 fig, 11 ref.

Descriptors: *Tracers, *Dye releases, *San *Bed load, *Sediment transport, Bottom se ments, Equipment, Instrumentation, Taggi Tracking techniques, Fluorescence.
Identifiers: Tracers (Fluorescent sand).

An oil drum may be made into a mechanical dev for the release of more than 250 kg of fluoresc tracer sand under water on the bottom. The dev basically consists of a drum with a false-bottom a a release mechanism which opens the bottom touching the sediment surface. When the drum lifted a little, the false-bottom opens allowing tracer sand to deposit on the bottom at the se ment surface. The drum has been used successfu in a number of tracer investigations of the Geolo cal Survey of India in varying operational con tions at sea and in tidal estuaries where the curre were very strong. REMOTE GROUNDWATER LEVEL METE FOR BOG STATIONS,
V. I. Yakovlev.
Translated from Trudy Gos Gidrol Inst-ta, No 1 p 70-79, 1969. Soviet Hydrology: Selected Pape No 5, p 442-449, 1969. 8 p, 6 fig.

Descriptors: *Bogs, *Water levels, *Telemet *Observation wells, *Gages, Water level fluctu tions, Instrumentation, Surveys, Data collectio Gaging stations, Stations, Water wells.
Identifiers: Bog water-levels.

A new remote-reading meter for measuring wa levels in bogs consists of several sensors, a cont panel with power supply sources, and a commu cation line. Float sensors (up to 10), which p ceive the changes in groundwater level, are stalled in measuring wells. The control panel located in the station building. It signals the we and measures the groundwater levels at their sit The scale readings give the direct values of level in the wells from the bog surface and do require further processing. There is no need

ating and thermally insulating the well after each servation in winter. (Knapp-USGS)
71-03966

)D-MOUNTED BOTTOM GRAB,
Ya. Solov'yev.
anslated from Trudy Gos Gidrol Inst-ta, No 172, 6-99, 1969. Soviet Hydrology: Selected Papers, ie No 5, p 450-452, 1969. 3 p, 2 fig.

scriptors: *Bottom sediments, *Sampling, edging, Equipment, Sediments, Mud, Sands.
ntifiers: *Bottom-sediment samplers.

od-mounted bottom grab is designed to sample tom sediments 30-50 mm thick without disturb- structure. The instrument takes samples of non- esive silt and sandy-gravelly deposits from the tom of rivers, canals, lakes, and reservoirs in er depths of up to 2 m and at flow velocities to 2 ec. The volume of the sample when the grab is is 300 cc. The device weights 3.5 kg and mea- es 450 x 159 x 132 mm. The bottom grab is gned to operate with one or two sets of rometric rods. The operating principle of the om grab is based on the mechanical separation he sediment sample from the bottom of a body ater by a rotating scoop. (Knapp-USGS)

TED STATES COAST GUARD OCEANO- APHIC SENSOR STUDY. VOLUME I. TE-OF-THE-ART OF OCEANOGRAPHIC D METEOROLOGICAL SENSORS, TUTORI- DISCUSSION,
s Instruments, Inc., Dallas. Services Group.
ert J. Gaillard, Kenneth I. Heldebrandt, Robert Crosby, and Thomas Cass.
lable from NTIS as AD-711 322, $3.00 in r copy, $0.95 in microfiche. Rept. No TI- 9-1a, 21 May 70. 213 p, 105 ref. Contract -CG-90505-A.
tifiers: *Sensors, State-of-the-art reviews, teorological parameters, Sensors, *Oceano- hic data, Transducers, Underwater sound pment, Pressure gages, Optical instruments, istors, Oceanographic equipment, Digital ms, Specifications, Probes, Coast Guard rch.

volume presents the findings of the task by nting Coast Guard operational requirements summarizing conclusions in a descriptive ation for each parameter. The present state- e-art of oceanographic sensor technology is ated as related to the operational require- s established by the Coast Guard as a basis for tudy. These operational requirements are, in selves, ambitious goals. However, as a result e knowledge gained in performing this study, equirements may be scaled; alternatively, by ifying the inability of present instruments to the requirements, an incentive is established complishing the necessary development work d to meet the goal. Measurement discussion ovided for each parameter to be used as ground information for the prospective instru- user. There are also brief general discussions gnal conditioning and encoding techniques n power sources. The measurement of each neter is discussed in the following sequence: ral, indicating usual measurement require- and defining (where deemed necessary) the associated with the measurements; Trans- types associated with the measurements; and of-the-art, frequently including some specu- about the course of future developments. discussion of each measurement is not in- d to be comprehensive but only tutorial to the that a person involved with the measurement for the first time can comprehend the type, purpose, and techniques utilized to make the measurement. For those readers who wish to pursue the subject in greater depth, there is an extensive bibliography of material related to each measurement. The final section indicates the relative costs of different measurement techniques for each parameter. It does not provide actual price information because price is so highly dependent on the terms of a specific purchase order. (See also W71-04010 thru W71-04014)

UNITED STATES COAST GUARD OCEANOGRAPHIC SENSOR STUDY. VOLUME II. STATE-OF-THE-ART OF OCEANOGRAPHIC AND METEOROLOGICAL SENSORS, CATALOG,
Texas Instruments, Inc., Dallas. Services Group.
Robert J. Gaillard, Kenneth I. Heldebrandt, and Robert M. Crosby.
Available from NTIS as AD-711 323, $3.00 in paper copy, $0.95 in microfiche. Report No TI-59009-1b, 21 May 70. 354 p. Contract DOT-CG-90505-A.
Identifiers: *Sensors, State-of-the-art reviews, *Meteorological instruments, Catalogs, *Oceanographic data, Sensors, Optical instruments, Underwater light, Underwater sound, Ocean currents, pH, Salinity, Underwater communication systems, Dew point, Television communication systems, Atmospheric temperature, Cloud cover, Power supplies, Costs, Operation, Coast Guard research.

The primary function of Volume II is to present catalog listings indicating a broad spectrum of available off-the-shelf hardware. Proprietary interest has unfortunately prevented the inclusion of several state-of-the-art sensors in the catalog listings. Inadvertent omissions of available sensors and recent advances in sensor technology may also have occurred. By questionnaires and telephone calls, 178 manufacturers were contacted; 100 responded. Similarly, 58 questionnaires were mailed to users of oceanographic instruments, with 20 replying. Visits were made to major manufacturers and users to amplify material received and to ascertain the direction of development not yet published. Additionally, all catalog sheets were forwarded to the manufacturer for his final review before being incorporated into the catalog; therefore, all accuracy statements in the catalog section are those currently being quoted by the manufacturer. This report summarizes the state-of-the-art of oceanographic and meteorological instrument technology in the year 1970 and provides the bases by which, if maintained, an up-to-date catalog of sensor availability can be referenced by future designers. (See also W71-04009)
W71-04010

UNITED STATES COAST GUARD OCEANOGRAPHIC SENSOR STUDY. VOLUME III. THE SURVIVAL ENVIRONMENT FOR OCEANOGRAPHIC AND METEOROLOGICAL SENSORS,
Texas Instruments, Inc., Dallas. Services Group.
Robert M. Crosby, Frank H. MacDonald, Thomas R. Livermore, and William Gumma.
Available from NTIS as AD-711 325, $3.00 in paper copy, $0.95 in microfiche. Report No Ti-59009-2, 21 May 70. 123 p, 28 ref. Contract DOT-CG-90505-A.
Identifiers: *Sensors, Protection, *Oceanographic data, Sensors, *Meteorological parameters, Corrosion, Fouling, Hydrostatic pressure, Vibration, Thermal shock, Survival, Radiofrequency interference, Coast Guard research, Sea water environment.

Task 2 describes the operational, transport, and storage environments for oceanographic and meteorological field instruments. The study resulted in recommendations for environmental protection and called attention to areas needing further work in order to accomplish adequate sensor protection at sea. (See also W71-04009)
W71-04011

UNITED STATES COAST GUARD OCEANOGRAPHIC SENSOR STUDY. VOLUME IV. THE FORMATTING AND TRANSMISSION OF DATA FROM OCEANOGRAPHIC SENSORS,
Texas Instruments, Inc., Dallas. Services Group.
Wilton J. Daniel, Jr., and Jerry R. Yeargan.
Available from NTIS as AD-711 326, $3.00 in paper copy, $0.95 in microfiche. Report No 59009-3, May 21, 1970. 165 p, 55 ref. Contract DOT-CG-90505-A.
Identifiers: *Sensors, *Data transmission systems, *Oceanographic data, Sensors, *Meteorological parameters, Data processing systems, Signal-to-noise ratio, Amplitude modulation, Bandwidth, Multiplex, Stabilized platforms, Buoys, Underwater, State-of-the-art reviews, Tables, Coast Guard research, Data acquisition.

The report examines the problem of transmitting oceanographic data from underwater sensors to a variety of surface platforms as constrained by operational requirements set forth by the United States Coast Guard. Recommendations concerning a system to meet these requirements are made. The report also examines the formats necessary to convey the information collected from the platforms to users of both perishable and archived data. (See also W71-04009)
W71-04012

UNITED STATES COAST GUARD OCEANOGRAPHIC SENSOR STUDY. VOLUME V. ANALYSIS OF APPLYING STANDARDIZATION TECHNIQUES TO OCEANOGRAPHIC SENSORS,
Texas Instruments, Inc., Dallas. Services Group.
P. David Call, and J. Daniel Wilton, Jr.
Available from NTIS as AD-711 327, $3.00 in paper copy, $0.95 in microfiche. Report No 59009-4, June 3, 1970. 54 p, 9 ref. Contract DOT-CG-90505-A.
Identifiers: *Sensors, Standarization, *Oceanographic data, Sensors, *Meteorological parameters, Design, Standards, Specifications, Reliability (Electronics), Reliability, Maintainability, Coast Guard research.

The report examines the areas in which oceanographic sensors can be standardized to meet the operational requirements set forth by the United States Coast Guard. Recommendations are made for areas in which cost reductions can be realized through the use of standards. (See also W71-04009)
W71-04013

UNITED STATES COAST GUARD OCEANOGRAPHIC SENSOR STUDY. VOLUME VI. TEST REQUIREMENTS FOR OCEANOGRAPHIC AND METEOROLOGICAL SENSORS,
Texas Instruments Inc., Dallas. Services Group.
Frank H. MacDonald, Lawrence B. Sullivan, and Thomas R. Livermore.
Available from NTIS as AD-711 328, $3.00 in paper copy, $0.95 in microfiche. Report No TI-59009-5, May 31, 1970. 193 p, 6 ref. Contract DOT-CG-90505-A.
Identifiers: *Sensors, Reliability, *Oceanographic data, Sensors, *Meteorological parameters, Performance (Engineering), Environmental tests, Production control, Handling, Storage, Transportation, Design, Coast Guard research.

Task 5 was concerned with the development of test and calibration techniques required to measure the sensor compliance with the performance, mechanical, and electrical specifications. A test program was written that provides for a rigorous examination of each basic sensor design as it applies to performance in the operational environment and its ability to survive the environmental imposed by storage, transportation, predeployment, and deployment handling. (See also W71-04009)
W71-04014

NEW CHART OFFERS FAST PERMEABILITY ESTIMATE,
California Univ., Berkeley.

J. Kumar.
World Oil, Vol 172, No 2, p 38, February 1, 1971. 1 p, 4 ref.

Descriptors: *Permeability, *Electrical well logging, Resistivity, Borehole geophysics, Aquifers, Porosity, Porous media, Saturated flow.
Identifiers: Specific permeability.

Specific permeability can be found quickly and easily from electric log data using an empirical formula developed from experimental work with several different types of sandstones. Results compare closely with core analysis in many cases. This equation is valid only for clean (shale free) and preferentially water wet sands. The solution to this equation is plotted on an accompanying chart. (Knapp-USGS)

A RAPID METHOD OF COMPUTING AREAL RAINFALL,
Aston Univ., Birmingham (England).
T. R. E. Chidley, and K. M. Keys.
Journal of Hydrology, Vol 12, No 1, p 15-24, December 1970. 10 p, 4 fig, 2 tab, 2 ref.

Descriptors: *Rain gages, *Rainfall, *Depth-area-duration analysis, *Distribution patterns, Data processing, Hydrologic data, Meteorological data, Data collections, Statistical methods, Least squares methods, Monte Carlo method, Isohyets.
Identifiers: *Rainfall distribution.

A polynomial surface is fitted to the recorded rainfall for a given time period. This polynomial is integrated over the area of interest. The result is a set of weights for each gage which, when multiplied by the observed rainfall at each gage give the total volume of rainfall on the area. Once the weights have been determined for a given gage network and area the method is suitable for hand computation. (Knapp-USGS)
W71-04123

THE UNIVERSALISATION OF THE CO-ORDINATES OF LOGARITHMIC WEIR PROFILES,
Indian Inst. of Science, Bangalore. Dept. of Civil and Hydraulic Engineering.
D. Chandrasekaran, and N. S. Lakshmana Rao.
Journal of Hydraulic Research, Vol 8, No 4, p 395-402, 1970. 8 p, 2 fig, 1 tab, 2 ref.

Descriptors: *Calibrations, *Weirs, *Discharge measurement, *Stream gages, *Stage-discharge relations, Discharge (Water), Surface waters, Streamflow.
Identifiers: *Weirs (Logarithmic section).

Logarithmic weirs in which discharge varies as the logarithm of head, have less relative error in discharge computation for a given relative error committed in head measurement than other weirs. It is desirable to have universalized coordinates of complicated weir profile equations, especially when a trial and error procedure is involved in the selection of a suitable size of a particular type of weir for measuring a specific discharge. Universalization of the coordinates of logarithmic weirs was calculated and tabulated. (Knapp-USGS)

DETECTION OF PRECIPITATION BY RADAR,
Royal Observatory, Hong Kong. Div. of Research and Climatology.
P. C. Chin.
In: Forecasting of Heavy Rains and Floods, Proc Joint Seminar of Regional Associations 2 and 5 of World Meteorological Organization, Nov 11-23, 1968, Kuala Lumpur, Malaysia, published by World Meteorological Organization, Geneva, p 27-43, 1970. 17 p, 3 fig, 2 tab, 20 ref.

Descriptors: *Remote sensing, *Radar, *Weather forecasting, *Weather patterns, *Precipitation (Atmospheric), Instrumentation, Reviews, Meteorology.
Identifiers: *ECAFE, *Asia.

General factors which affect the use of radar for the detection of precipitation are reviewed. The common method used in the measurement of the rate of precipitation is based on the statistical relationship between the intensity of precipitation and the reflected power from the precipitation elements received by the radar. Radar is especially useful for detecting and measuring precipitation in areas where rain gages are sparsely distributed or where localized heavy rainfall frequently occurs. Since the radar system usually permits an integration of precipitation amounts over time and area to be made by electronic or other means, its application is of particular importance in hydrological operations such as flood forecasting, dam control and others. ELIMINATION OF 'MEMORY' PEAKS COUNTERED IN AQUEOUS-INJECTION CHROMATOGRAPHY,
Federal Water Pollution Control Administra Cincinnati, Ohio. Analytical Quality Control L
Ronald C. Dressman.
Journal of Chromatographic Science, Vol 8, p May 1970. 2 fig, 4 ref.

Descriptors: *Gas chromatography, *Analy techniques, Laboratory equipment, Phenols, ganic matter.
Identifiers: *Chemical interference, Me peaks.

The source was investigated of 'memory p which interfere with analysis during gas chroma raphy. The tests were conducted using phenols organic acids. The results indicated that the m portion of the 'memory peaks' resulted from dup in the injection port. A small portion, app mately 4% of the original response, was attrib to sorption at the head of the column. An adva injection port was designed such that the ca gas would sweep the entire injection chambe that 'memory peaks' would be prevented or at greatly reduced. On-column injection was bined with this design to further eliminate the sibility of sorption of material on the metal su of the injection block since use of such ma could also result in 'memory peaks'. Tests usin column injection with an injection port effect prevented 'memory peaks' produced by phe and eliminated the need for water flushing each sample or standard injection. In the case o ganic acids, the system reduced the 'me peaks' to about 4% of the original response. T peaks were completely eliminated with just water flush. The redesigned injection block is trated. A LIMESTONE-FILLED, ARTIFICIAL S STRATE SAMPLER-FLOAT UNIT FOR C LECTING MACROINVERTEBRATES LARGE STREAMS,
Federal Water Pollution Control Administra Cincinnati, Ohio.
William T. Mason, J. B. Anderson, and George Morrison.
The Progressive Fish-Culturist, Vol 29, No 2, 1967. 74 p, 2 fig.

Descriptors: *Macroinvertebrates, *Sampling, Limestone, Equipment, Floats, Sampling.
Identifiers: *Artificial substrates, Euphotic zone, Basket sampler, Sample preservation, FWQA methods.

The Water Pollution Surveillance System uses a cylindrical, welded-wire, chromium plated 'Bar-B-Q' basket filled with limestone and suspended from a polyurethane filled float to collect macroinvertebrates in large streams. The basket is 7 inches in diameter and 11 inches long. Experience indicates that the optimum exposure is about 6 weeks at a 5 foot euphotic zone depth. The organisms are removed from the rocks in water with a stiff-bristled brush, washed in a No. 30 Sieve, bottled, and preserved in 70 percent ethanol or 5 percent formalin. Macroinvertebrates are recorded as number-per-sampler. (McCann-Battelle)

SOIL FREEZING DETERMINED WITH FOUR TYPES OF WATER-FILLED TUBES,
Forest Service (USDA), Ogden, Utah. Intermountain Forest and Range Experiment Station.
Norbert V. De Byle.
USDA Forest Serv Res Note INT-127, December 1970. 8 p, illus.

Descriptors: *Freezing, *Soil temperature, *Soil moisture meters, *Soil water, Snow cover, Thermal properties, Frozen soils, Permafrost, Thawing, Frozen ground, Heat transfer, Instrumentation, Measurement, Estimating, Nuclear moisture meters, Utah.

During two winters (1966-67 and 1967-68) periodic determinations were made of soil temperatures and ice column depths in four types of tubes inserted in the soil at three sites in northern Utah. The 0C. isotherm varied in depth from the surface to 21 inches at lower elevation sites in Logan and to 41 inches on an exposed mountain ridge at 8,870 feet elevation. Steel tubing (1.55-inch inside diameter), commonly used as access tubes for neutron probes used in soil-water measurements, proved to be as good as steel or plastic pipe as casings for water-filled frost meter tubes. WATER-QUALITY DATA FOR THE FLAMING GORGE RESERVOIR AREA, UTAH AND WYOMING,
Geological Survey, Salt Lake City, Utah.
R. J. Madison.
Utah Basic-Data Release No 20, 1970. 33 p, 4 fig, 4 tab, 4 ref.

Descriptors: *Water quality, *Reservoirs, *Utah, *Wyoming, *Chemical analysis, Water analysis, Water properties, Depth, Vertical migration, Seasonal, Streams, Streamflow, Discharge measurement, Statistical methods, Correlation analysis, Data collections, Hydrologic data.
Identifiers: *Flaming Gorge Reservoir (Utah and Wyo.), Chemical Concentration relationships, Weighted-Average Concentrations.

This is a basic-data report of water quality in Flaming Gorge Reservoir in Utah and Wyoming. The construction of Flaming Gorge Dam began in 1957, and the reservoir began storing water in November 1962. This report tabulates the chemical-quality data which were collected during the study (1966-68) and summarizes some of the data available prior to closure of the reservoir. Three sets of data were collected from the reservoir during the study. The sampling locations and the data are shown. At each of the 13 collection sites in the reservoir, samples were collected at various depths from the surface to the bottom. Samples for complete chemical analysis were collected from 6 sites at both the beginning (October 1966) and the end (September 1968) of the data-collection phase of the study. The variation in dissolved ions with depth for these two sets of data are summarized. Samples for partial analysis were collected from 9 sites in September 1967, and the partial analyses are tabulated. Chemical-quality and water-discharge data were also collected from 19 sites on the minor tributaries to the reservoir during the summer and fall of 1967. These data are listed in 2 tablex and are summarized in graphs. Summary graphs of the mean annual weighted-average concentrations of selected constituents for the period 1957-67 are included. CATALOG OF INFORMATION ON WATER DATA, EDITION 1970 - INDEX TO WATER QUALITY SECTION.
Geological Survey, Washington, D.C. Office of Water Data Coordination.

Geological Survey Water Data Catalog, 1970. 443 p, 2 fig, 2 exhibits, 4 tab.

Descriptors: *Data collections, *Hydrologic data, *Water quality, *Documentation, *Data storage and retrieval, Networks, Monitoring, Sampling, Maps, Instrumentation, Stations, Libraries, Investigations.
Identifiers: *Catalog of Information on Water Data.

An index is presented for use in retrieving water quality data from the Catalog of Information on Water Data, a record of activities in water data collection in the U.S. The Catalog is a file of information that is accessible through data-retrieval procedures--it contains information about water-data acquisition activities but does not contain the actual data, which must be obtained from the reporting agencies. Input to the Catalog consists of information supplied by Federal, State, and local agencies that acquire water data directly in the field and laboratory. All information is stored on media suitable for data processing, supplemented

by microforms and maps. Information from the Catalog (output) is made available through indexes such as this publication, which is the index to the water quality section of the Catalog. This index reflects activities as of January 1, 1970, and is the fourth edition of the 'Water Quality Index', the first of which was the 1966 edition. Included in this index are (1) identification and location of stations, (2) major types of data collected, (3) frequency of data collection, (4) in what form the data are stored, and (5) agencies reporting the activities. (Woodard-USGS)

A GUIDE TO THE COMMON DIATOMS AT WATER POLLUTION SURVEILLANCE SYSTEM STATIONS,
Federal Water Pollution Control Administration, Cincinnati, Ohio. Div. of Pollution Surveillance.
Cornelius I. Weber.
Available from: EPA WQO, Analytical Quality Control Laboratory, 1014 Broadway, Cincinnati, Ohio 45202. June 1966. 101 p, 164 fig.

Descriptors: *Diatoms, *Bioindicators, *Plankton, Colorado River, Columbia River, Delaware River, Hudson River, Mississippi River, Missouri River, Ohio River, Rio Grande, St. Lawrence River, Tennessee River, Great Lakes.
Identifiers: Sorting, Identification, Animas River, Apalachicola River, Arkansas River, Illinois River, Kanawha River, Klamath River, Little Miami River, Potomac River, Red River, Savannah River, Schuylkill River, Snake River, Yellowstone River.

A total of 164 diatom species are described and illustrated, representing 43 of the common genera found at FWPCA Water Pollution Surveillance System stations. Some of the species were selected primarily to demonstrate the morphological diversity within the genera. The geographical distribution of 96 of the species is shown in an accompanying chart. This guide was prepared to serve as a bench reference for biologists in the laboratory who are being trained in diatom identification. The guide also contains a glossary and generic key. The key was constructed with the beginner in mind, and is based entirely on the shape and markings of the diatom cell wall as observed in material mounted in Hyrax. No attempt was made to place the taxa in their proper phylogenetic order. (McCann-Battelle)

USING COMPUTERS TO HELP EVALUATE FLOOD PROTECTION MEASURES,
Economic Research Service, Washington, D.C. Natural Resource Economics Div.; and Oklahoma State Univ. Stillwater. Dept. of Agricultural Economics.
Ronald D. Lacewell, and Vernon R. Eidman.
Oklahoma State University Agricultural Research, Oklahoma Current Farm Economics, December 1969, Vol 42, No 4, p 5-11. 1 tab, 6 ref.

Descriptors: *Evaluation, *Computer models, *Computer programs, *Flood protection, *Water conservation, Resource allocation, Benefits, Flood routing, Productivity, Land use, Flood plains, Planning, Estimating, Flood damage, Water management (Applied), Net income, Oklahoma, Damages, Data collections, Return (Monetary).
Identifiers: *Nuyaka Creek flood plain (Oklahoma), Inundation depth, Flood ranges, Occurrence probability.

A computer program for estimating flood damage incidence was developed to assist flood protection planning agencies and flood plain farmers. The model estimates damages for land use, productivity, inundation depth and location. Larger area damages are summations of these individual categories. The model computes damages by grids of sample sites and assigned possible flood ranges. Average annual damages are estimated by weighting damages for each storm by its occurrence probability. The model was tested by application to Nuyaka Creek flood plain, east-central Oklahoma. Care must be exercised in the method of measuring benefits to flood protection and land use adjustments. Flood protection benefits are the difference between net returns for present land use and no protection ($11,700), and net returns for optimum land use with protection ($107,200). The difference between net returns with and without flood protection for present land use ($6,700) is an estimate of minimum expected flood protection benefits. A table shows present and optimum flood plain land use pattern and associated dollar values with and without flood protection at Nuyaka Creek. (Popkin-Arizona)

8A. Structures

WATER, A PROGRESS REPORT.
California State Dept. of Water Resources, Sacramento.

Department of Water Resources, Bulletin No 151-67, September 1968. 32 p, 28 fig.

Descriptors: *Water transfer, *Aqueducts, *Water supply, *Water resources development, *Water conveyance, *Construction, Powerplants, Pumping plants, Hydrologic data, Seismic studies, Earthquake engineering, Multiple-purpose reservoirs, *California.

Progress is summarized in the construction of the State Water Project, the world's largest single water development project. It is designed to conserve and deliver 4.23 million acre-feet of water annually to meet demands throughout much of California until 1990. Much of the project planning is being implemented by local agencies. Capital costs are estimated to exceed $2.8 billion. Project customers will repay about 90 percent of the total capital costs. The federal government will pay 3 percent, and the state the remaining 7 percent. California customers will buy water from the State Water Project and will contract for the use of the proposed San Joaquin Master Drain to remove excessively saline agricultural wastes from the endangered lands of the San Joaquin Valley. Water will be supplied from lakes formed by five dams on the Feather River and its tributaries northeast of San Francisco. The regulated release of water from Lake Oroville will flow down the Feather and

Sacramento Rivers and into the Sacramento-San Joaquin Delta. A part of the flow will enter San Francisco Bay and the balance will be conducted by a Peripheral Canal and aqueducts to supply water to south bay areas, and community and agricultural users along the Central Valley, and as far south as Riverside. Power generation is also a feature of the Project. Descriptions are given of hydrologic and geologic data collection activities, and snow runoff and earthquake prediction. Design considerations and recreational facilities are described. Design features and operational methods are highlighted and construction progress is summarized. Completion is scheduled for 1972. (Poertner)

1939 RUNOFF INSTRUCTIONS FOR DESIGN OF STORM DRAINS, OFFICE STANDARD NO. 71.
Los Angeles Bureau of Engineering, Calif.

Office Standard No 71, 1966. 51 p, 23 fig, 8 tab.

Descriptors: *Drainage engineering, *Drainage practices, *Storm drains, *Storm runoff, *Design standards, Hydrology, Hydraulics, Urbanization, Rainfall-runoff relationships, Runoff forecasting, Surface runoff, Drainage systems, Conduits, California.
Identifiers: *Storm sewers, *Urban drainage, Los Angeles (Calif).

The publication is an assembly of tables, curves, and instructions for computation of urban storm runoff and for designing urban stormwater drains under various conditions of topography, imperviousness, soil types, slopes and precipitation intensities. The material was first printed in 1939 to serve as an office standard in the Storm Drain Design Division of the Bureau of Engineering. This printing contains revisions to previous printings and adds several new parts including: a section titled 'Hydrology of Steep Hillside or Mountainous Areas in Natural State', a formula for computing the adjusted time of concentration at junctions of a main-line storm drain with its laterals, and other charts and tables. The design instructions for computing runoff are based upon theories and methods outlined in two papers: (1) 'A Method of Computing Urban Runoff,' by W. I. Hicks (Transactions, American Society of Civil Engineers, Vol. 109, March 1945); and (2) 'Surface Runoff Determinations from Rainfall without Using Coefficients,' by W. W. Horner and S. W. Jens (Transactions, ASCE, Vol. 107 (1942), page 1039). Detailed instructions are given for applying the 'peak rate' method and the method of 'summing hydrographs' for computing runoff. Reduction factors to account for conduit detention in computing peak runoff flows are given. (Poertner)

MOLE DRAINAGE,
Arctic Construction and Frost Effects Lab., Boston, Mass.
Howard M. Williams, and James F. Haley.
Available from NTIS as AD-712 582, $3.00 in paper copy, $0.95 in microfiche. Technical Report No ACFEL-TR-38, Sept 1951. 36 p.
Identifiers: *Landing fields, Drainage, *Drainage, Structures, Soils, Plasticity, Earthhandling equipment, Pipes, Concrete, Mixtures, Asphalt, Cements, Grout, Sand, Stability, Pumps, Structural properties, Pavements, *Mole drainage, Portland cements.

A mole drainage system has proved very effective in reclaiming many areas of low-lying poorly drained agricultural lands and should prove a valuable tool in the construction of airfields under similar conditions. It is believed that even in soils containing some sand or silt, the mole drains would greatly increase drainage for short periods of time with resultant construction benefits. It is recognized that the mole drains would greatly increase drainage for short periods of time with resultant construction benefits. It was recognized that the mole drain's usefulness was severely limited unless some simple but effective method of making the drain a relatively stable structure in a wide variety of soil conditions could be achieved. It was to study this problem that a series of laboratory investigations and model tests were initiated in the Soils Laboratory of the New England Division, Corps of Engineers, in Boston in 1946. The investigations to date have followed two general paths of study: First, to attempt to strengthen the existing soil walls of the mole drain by a coating or liner cast in place during the passage of the mole plow and, second, to insert a suitable prefabricated liner into the mole drain behind the plow.

WATER MEASUREMENT PROCEDURES - IRRIGATION OPERATORS' WORKSHOP.
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.

Available from NTIS as PB-195 275, $3.00 in paper copy, $0.95 in microfiche. Edited by J. C. Schuster. Bureau of Reclamation Report REC-OCE-70-38, September 1970. 49 p, 52 fig, 37 ref.

Descriptors: *Hydraulics, *Hydraulic structures, *Irrigation, Parshall flumes, *Discharge measurement, *Water measurement, Closed conduit flow, Discharge coefficients, Weirs, Orifices, Current meters, Bibliographies, Irrigation operation and maintenance, Venturi meters, Radioisotopes, Field investigations, Flowmeters, Instrumentation.
Identifiers: Irrigation Operators' Workshop, Dilution method, Magnetic flow meters, Ultrasonic flow measurement, Constant-head-orifice T O.

Water Measurement Procedures were written primarily for use in the Irrigation Operators' Workshop classes as a teaching aid in presenting the fundamentals of water measurement to field personnel engaged in irrigation work. Technical material has been simplified to provide a clear understanding of water measurement devices and procedures. Basic hydraulics presented include the discharge equation, velocity head concept, orifice and weir relationships, and the effect of submergence. Factors affecting the accuracy of measurement such as work equipment, infrequent head measurement, and use of wrong measuring devices are analyzed. Commonly used devices and methods are discussed, including orifices, weirs, Venturi meters, Parshall and Venturi flumes, meter gates, constant head turnouts, and propeller meters; special devices and methods include vane deflection meters, acoustic and magnetic meters, and the dilution and radioisotope methods of measurement. Hints for troubleshooting poorly operating devices, suggestions to operators on how to do a good job, and a selected reading list for operators are given. This edition supersedes the previous editions numbered Hyd 552, 565, and 577.

THE TRAPEZOIDAL FREE OVERFALL,
Alberta Univ., Edmonton. Dept. of Civil Engineering.
N. Rajaratnam, and D. Muralidhar.
Text also in French. Journal of Hydraulic Resarch, Vol 8, No 4, p 419-447, 1970. 29 p, 12 fig, 2 tab, 18 ref.

Descriptors: *Stage-discharge relations, *Open channel flow, *Overfalls, Open channels, Hydraulics, Discharge measurement, Stream gages, Flumes, Canals.
Identifiers: *Overfalls (Trapezoidal).

A theoretical and experimental study of trapezoidal free overfall predicts the end depth ratio for horizontal and sloping channels. The pressure coefficient at the end section was obtained from direct pressure measurements and it lies between the values for rectangular and triangular overfalls. Two charts were constructed to facilitate the prediction of discharge when the end depth is known. Supplementary information regarding the flow profile, velocity field and the bed shear stress are presented. (Knapp-USGS)
W71-04128

EXPERIMENTAL STUDIES ON LINEAR PROPORTIONAL WEIRS WITH TRIANGULAR BOTTOMS,
Indian Inst. of Science, Bangalore. Dept. of Civil and Hydraulic Engineering.
N. S. Lakshmana Rao, and G. Purushotham.
Journal of Hydraulic Research, Vol 8, No 4, p 449-455, 1970. 7 p, 8 fig, 1 tab, 1 ref.

Descriptors: *Calibrations, *Weirs, *Discharge measurement, *Stream gages, *Stage-discharge relations, Discharge (Water), Surface waters, Streamflow.
Identifiers: *Weirs (Triangular section).

Because triangular weirs are more sensitive than rectangular weirs, especially at low flows, the rectangular base-weir of the Sutro weir can be advantageously replaced by a triangular bottom. None symmetrical and three asymmetrical linear proportional weirs with triangular bottoms were tested for different values of height and width. A nomogram was prepared for finding the discharge coefficient. (Knapp-USGS)

Identifiers: USSR, Rotors, Machine design, Stators, Gyroscopic effects.

Effect of quasi-elastic forces of electromechanical origin on the primary critical speed of a shaft in calculating natural frequencies of torsional and transverse vibrations is shown. New methods introduced by USSR hydroturbine manufacturers for calculating shaft stability should consider the generator not only as a concentrated mass but also for the electromagnetic field it creates. This leads to new phenomena, especially in determining critical speeds for transverse vibrations. An equivalent mechanical system with parameters depending on characteristics of generator windings and operating conditions can be substituted for the electromagnetic field in determining natural frequencies of torsional vibrations. Solving the differential equations shows that electromechanical vibration frequency is from 0.5-2.5 cps, indicating that calculation of these values is obligatory to construct a full frequency spectrum. For transverse vibrations, a 1-sided electromagnetic pull between the rotor and stator and forces of inertia on the deflection of the shaft must be considered. The author concludes that calculating the electromagnetic field for torsional vibrations gives a smaller value for natural vibration frequency and for transverse vibrations leads to a lowering of the primary critical speed. Sample calculations for a specific shaft are given.

EXPERIMENTAL INVESTIGATIONS OF HYDRAULIC TURBINES WITH COMBINED RUNNERS,
Bureau of Reclamation, Denver, Colo.
L. P. Gryanko, and V. G. Staritskii.
Translated from: Trudy Leningradskogo polytekhnicheskogo instituta No 297, p 63-67, 1968. Available from NTIS as PB-193 643T, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation Translation No 579, Aug 1969. 12 p, 6 fig, 5 ref.

Descriptors: *Hydraulic machinery, *Hydraulic turbines, Foreign design practices, Model tests, *Turbine runners, Laboratory tests, Efficiencies, Cavitation, Research and development, Mechanical engineering, Hydraulics, Surges, Turbulent flow, Testing machines, Discharge measurement, Hydraulic design, Foreign research.
Identifiers: USSR, Leningrad Polytechnic Inst, Krasnoiarsk Powerplant, *Machine design, Comparative studies.

The Hydraulic Machinery Laboratory at Leningrad Polytechnic Institute has developed a combined Francis and propeller runner to fit the operating conditions and dimensions of Krasnoiarsk Hydropowerplant. Models of 2 alternative designs of this runner were tested and the data compared with that of Runner RO-697, the Francis runner used at Krasnoiarsk. The only dimensional design change is that the flare angle of the lower band is 13 deg instead of the 20 deg of RO-697. The model tests and data analysis led to these conclusions: (1) Since specific speed and discharge capacity of the combined runner are significantly higher than for RO-697, using this runner at Krasnoiarsk would increase unit capacity at the generator to 580 mw and reduce the total number of units by one. (2) Energy factors for the improved model design showed that efficiency was only 0.5 or 1% less than that of RO-697. (3) Cavitational qualities were about equal. (4) Pressure surges beyond the new runner were 30-40% lower than beyond RO-697, reducing turbulence in design operating conditions and also during startup at reduced heads. The combined runner's greater discharge capacity will increase its operational reliability over that of RO-697.

SARATOV HYDROELECTRIC POWERPLANT CONSTRUCTION DATA,
Bureau of Reclamation, Denver, Colo.
L. I. Kudoyarov, and N. P. Borodin.
Translated from: Gidrotekhnicheskoe Stroitel'stvo No 4, p 4-10, 1966. Available from NTIS as PB-193 629T, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation Translation No 703, Aug 1967. 24 p, 6 fig.

Descriptors: Hydroelectric powerplants, Kaplan turbines, Foreign projects, Precast concrete, Reinforced concrete, Reinforcing, *Forms, Concrete, *Concrete technology, Concrete structures, Concrete plants, Aggregates, Erection, Earth handling equipment, Excavation, Foundations, Joints, Dams, Aprons, Earth dams, Dikes, *Hydraulic fills, Multiple purpose structures, Locks, Slope protection, Fish handling facilities, Construction, Hoisting machinery, Manufacturing.
Identifiers: USSR, Hydromechanization, Saratov Powerplant (USSR), Volga Cascade System (USSR), Run-of-the-river powerplant.

Saratov hydrocomplex, the seventh step of the Volga cascade to be constructed in the USSR, is unique among low-head, run-of-the-river powerplants, because it is largely constructed of huge precast, reinforced concrete elements made monolithic by careful grouting of the joints and overlap welding of protruding reinforcement rods. Among the basic features described are: the common structure containing 21 vertical and 2 horizontal units for passing surplus river discharges and generating power; fish-handling facilities; two-level railroad and highway bridge; and the double single-stage dry-dock-type ship locks. Interesting features include the 3-level powerhouse arrangement with turbine bypass spillways equipped with louvered fish inlets; the earthfill dam and dikes with interlocking concrete slab slope protection; and the upstream apron constructed of 10-m-thick hydromechanized fill sandwiched between concrete slabs. The production line for precast reinforced concrete elements weighing up to 200 tons each and erection methods developed to handle such loads are described. This includes the crane-operated tilter for uprighting slabs manufactured in a horizontal position. Production methods for forming, automatic welding of reinforcement frames, pouring and vibrating, and steam-curing are given.

DRAINAGE LINE DEPTH,
Bureau of Reclamation, Denver, Colo.
I. M. Krivonosov.
Translated from: Gidrotekhnika i Melioratsiya Vo 18, No 6, p 44-51, 1966. Available from NTIS a PB-193 617T, $3.00 in paper copy, $0.95 i microfiche. Bureau of Reclamation Translation N 685, Oct 1967. 11 p, 5 fig, 1 tab, 11 ref.
Identifiers: *Soils, Drainage, Permeability, Clay Sand, Penetration, Cracks, Water, Fluid flow Freezing, Melting, Reclamation, Terrain, USSR Translations, Land reclamation.

The principal factors determining the selection o drainage line depth are: the filtering capacity of the soils, the depth to which the soil freezes and the course of its thawing, the purpose for which the land is being reclaimed, and the critical calculated period for removal of ground waters. Under similar soil conditions but with different freezing depth the rational solutions of this problem may differ. For water-permeable noncoherent soil conditions the relationship between the depth of the drains and the distance between them is sufficiently well established, and among the specialists no differences of opinion exist on the problem of the optimum drain depth. However, there are different opinions on the depth at which a drain should be placed in clayey soils and ground. The question of the necessary depth for drains in clayey loam and clayey soil-ground is examined.

lity control field testing of aggregate, cement,
concrete at Krasnoiarsk Dam, USSR, showed,
f Sept 1964, that: (1) washed sands and gravel
specifications, except for larger fractions
re a second sorting at the concrete plant was
mmended; (2) cement was very satisfactory as
ineral composition, heat outflow, and strength;
both concrete control specimens and cores
ed from the mass concrete of the dam columns
within specification limits for strength and
r impermeability; and (4) temperature control
oncrete at placement was still not acceptable
ummertime. However, in the 2 yrs since the
mass concrete placement (8-61), many
lems had to be faced and many changes made
ocedures, equipment, and organization in the
gate processing plants, the Krasnoiarsk Ce-
t Plant, and the 2 mixing plants to achieve the
ed results. A fully automated continuous-flow
rete mix plant for both portland cement and
portland cement concretes and a 3-section
ing plant for special types or batches of
rete are in use. The article discusses problems
e automated equipment, temperature control,
ly, and construction site organization that had
resolved. The figures show layout for continu-
low mix plant, zoning of dam for types of
retes, cement chemical composition, and test
ts.

ion equipment, Evaluation, Saratov Power-
(USSR).

USSR is evaluating the technical effectiveness
conomy of using precast reinforced concrete
ural components to erect large hydraulic
ures, such as the experimental powerplants of
on the Dneiper and Saratov on the Volga. The
ry conclusion drawn was that the use of this
od must be evaluated separately for each pro-
n relation to local conditions and design
ia. To effect actual economics, designers can
ardize the recurring components of separate
of powerplants, such as enclosures for spiral
and draft tubes; embedded structural slots,
keys, drains, etc.; inspection and drainage galleries; and reinforced panels for run-of-the-river powerplants with not over 50 m of head. Only for run-of-the-river plants with heads less than 20 m can the exclusive use of these components in a structure be justified technically and economically. Manufacturing costs can be reduced to 40-45 rubles cu m to effect in-place costs of 50-60 r/cu m. Ideal use is building a series of 20 such plants in sequence of 2-3 at a time, served by the same mobile production-line manufacturing plant and construction equipment. Forming joints between the components, a major problem, has now been satisfactorily resolved.

ANNUAL REPORT, JULY 1, 1969-JUNE 30, 1970,
North Carolina Water Resources Research Inst., Raleigh.
David H. Howells.
Available from NTIS as PB-197 120, $3.00 in paper copy, $0.95 in microfiche. Report UNC-WRRI-71-00, (1970). 49 p. 7 tab, 19 fig. OWRR Program A-999-NC (21).

Descriptors: Education, Colleges, Universities, Training, North Carolina, Allotments, Projects, Grants, Contracts, Programs, Research and Development.

The Institute's research program for fiscal year 1969-70 was supported by the annual allotment and seven matching grants from the Office of Water Resources Research, U.S. Department of the Interior, non-federal matching and other funds from the State of North Carolina and private industry, and one grant from the Z. Smith Reynolds Foundation. The total value of the program in 1970 exceeded one-half million dollars--a five-fold increase since the first full year in 1966. This included twenty-three research projects and other activities involving thirty-two man-years of graduate students, faculty and staff. This report contains description of water resource problems and related research projects, summary of research findings, and discussion of program development, education, and public service programs.

BUREAU OF RECLAMATION APPROPRIATION ACTS AND ALLOTMENTS: 1966 STATISTICAL SUPPLEMENT.
Bureau of Reclamation, Denver, Colo.

1968. 579 P, 2 INDEXES, 471 TAB.

Descriptors: *Federal reclamation law, *Statistics, *Allotments, *Data collections, Financing, Administrative agencies, Administration, Government finance, Grants, Legislation, Cost allocation, Loans, Reclamation, Missouri River Basin, Federal budgets, Federal government, United States, Federal jurisdiction, Assessments, Legal aspects, Water resources development, Economics, Loans.

Generally, this statistical supplement provides detailed information relating to the funding of those various water resource projects over which the Bureau of Reclamation has some degree of responsibility. Presented is a tabulation of appropriation acts and allotments to 471 Bureau of Reclamation projects and activities. Chapter one and two deal with those public and private appropriation acts passed for the Bureau of Reclamation by the 87th through the 90th Congresses. The balance of the report contains statistical tables regarding appropriations and allotments in fiscal years 1903 through 1966. The report excludes funding activity relating to: (1) appropriation transfers to other governmental agencies or projects, and (2) unused appropriations. Chapter four contains detailed tables regarding 176 specific projects or activities funded through the Bureau of Reclamation. Allotments made to 145 activities and projects within the Missouri River Basin are listed in Chapter five. Chapter six presents statistics on Bureau of Reclamation loan programs. Project allocations from emergency relief appropriations are set forth in Chapter seven, and water conservation and utility project allotments are presented in Chapter eight. (Earl-Florida)

A chronoloigcal compilation of allotments and appropriations for the Bureau of Reclamation during the period 1903-1960, this publication lists: (1) allotments authorized by the Secretary of the Interior, (2) appropriation acts of Congress, (3) private laws dealing with reclamation, (4) contingency funds allotted, (5) flood control appropriations made to the War Department, (6) soil and moisture conservation allotments, (7) emergency relief appropriations, (8) civiliam public service camp and conservation corps allotments, and (9) interagency transfers of appropriations. Within the text of the various appropriations and allotments, frequent mention is made of specific levee systems, river development, river-basin development, hydroelectric power projects, dam projects, and other water-related projects within the purview of the Bureau of Reclamation. A listing of water-conservation-and-utilization project funds transferred to other governmental agencies is also presented. (Earl-Florida)

W71-04142 02A

TROPHIC LEVEL
THE ROLE OF AQUATIC VASCULAR PLANTS IN THE EUTROPHICATION SELECTED LAKES IN WASTERN MASSACHUSETTS,
W71-03918 05C

TROPICAL CYCLONES
SURVEY OF OBJECTIVE METHODS USED IN HONG KONG FOR PREDICT TYPHOON MOVEMENT,
W71-04158 02B

LOWER AND MIDDLE IRRAWADDY FLOODS IN RELATION TO HEAVY RAINFALL IN THE HEAD WATER REGIONS OF CHINDWIN AND IRRAWA RIVERS,
W71-04165 02E

TRUCKEE RIVER(NEVADA)
FLOOD PLAIN INFORMATION, TRUCKEE RIVER, RENO-SPARKS-TRUCK MEADOWS, NEVADA.
W71-04144 04A

TRUST DOCTRINE
OYSTERMEN'S DOCK COMPANY V DOWNING (LAND UNDER TIDAL WATE HELD IN PUBLIC TRUST).
W71-04329 06E

TUBIFEX TUBIFEX
THE EFFECT OF SOME SOLVENTS ON LOWER WATER ANIMALS AND ON FISHES,
W71-03854 05C

TUCSON
ECONOMIC FEASIBILITY OF SELECTIVE ADJUSTMENT IN USE OF SALVAGEABLE WATERS IN THE TUCSON REGION, ARIZONA,
W71-04269 05D

TUNISIA
IRRIGATION DEVELOPMENT IN TUNISIA,
W71-04232 03F

TURBINE RUNNERS
EXPERIMENTAL INVESTIGATIONS OF HYDRAULIC TURBINES WITH COMBINED RUNNERS,
W71-03998 08C

TYPHOON FORECASTING
SURVEY OF OBJECTIVE METHODS USED IN HONG KONG FOR PREDICT TYPHOON MOVEMENT,
W71-04158 02B

TYPHOONS
ENVELOPE-FREQUENCY RELATIONS FOR MAXIMUM FLOODS IN MONSOO

AREAS OF THE ECAFE REGION.
W71-04117 02B

SURVEY OF OBJECTIVE METHODS USED IN HONG KONG FOR PREDICTING TYPHOON MOVEMENT,
W71-04158 02B

SOME EXAMPLES OF HEAVY RAINFALL IN JAPAN,
W71-04166 02B

THE PROBLEM OF FLOOD PREDICTION ON THE EAST COAST OF WEST MALAYSIA,
W71-04167 02B

HEAVY RAINFALL IN PAKISTAN AND ITS ASSOCIATED FLOOD,
W71-04168 02B

HEAVY RAINFALL AND ASSOCIATED FLOODS IN WEST PAKISTAN,
W71-04169 02B

THE CIRCULATION PATTERN OVER SINGAPORE AND THE EAST COAST OF WEST MALAYSIA DURING JANUARY AND FEBRUARY 1967 COMPARED WITH THAT OF JANUARY AND FEBRUARY 1968,
W71-04170 02B

TIMATE DISPOSAL
MINERAL RECOVERY FROM CONCENTRATED BRINES,
W71-04223 02K

TRAFILTRATION
SOLIDS SEPARATION BY ULTRAFILTRATION FOR CONCENTRATED ACTIVATED SLUDGE,
W71-04087 05D

ERGROUND STORAGE
EFFECT OF DISPERSION, GRAVITATIONAL SEGREGATION, AND FORMATION STRATIFICATION ON THE RECOVERY OF FRESHWATER STORED IN SALINE AQUIFERS,
W71-03870 02F

ERGROUND WATER STORAGE
EFFECT OF DISPERSION, GRAVITATIONAL SEGREGATION, AND FORMATION STRATIFICATION ON THE RECOVERY OF FRESHWATER STORED IN SALINE AQUIFERS,
W71-03870 02F

T HYDROGRAPHS
ANALYSIS OF THE RELATION BETWEEN PRECIPITATION AND FLOOD FLOW WITH THE AID OF A TRIPLE TRANSFORMATION BASED ON THE UNIT HYDROGRAPH METHOD (FRENCH),
W71-03980 02A

ONSTRUCTION OF THE UNIT HYDROGRAPH BY THE METHOD OF HYDROLOGIC ANALOGY (FRENCH),
W71-03981 02E

TED STATES
ATER SUPPLY OUTLOOK FOR THE WESTERN UNITED STATES, 1970-71 ATER YEAR.
W71-03927 02B

ATURATED FLOW
ATURATION-UNSATURATION TRANSITION IN INFILTRATION TO A NON-NIFORM SOIL PROFILE,

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the EPA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.

Supported by the Environmental Protection Agency in cooperation with WRSIC.

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Agricultural livestock wastes at the Department of Agricultural Engineering of Iowa State University.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 4, NUMBER 9
MAY 1, 1971

THE LIBRARY OF THE
NOV 17 1971
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

W71-04351 -- W71-04850

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 4, NUMBER 9
MAY 1, 1971

W71-04351 -- W71-04850

of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency, Water Quality Office. A directory of the Centers appears on inside back cover.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

nt factors influencing the flood flow in small an be expressed as a function of the con- on or lag time. From the example of an ex- tal basin in Czechoslovakia, the relation- concentration time and peak discharges is trated. The recurrence interval of the peak ge and the rain intensity are also taken into ration. In order to investigate the influence rent factors on the concentration time, of rainfall-runoff process are considered. A model of a watershed is being developed. The process is simulated with the help of a rain simulator. Watershed models in different scales are used to investigate the development of similarity criteria. Theoretical approaches to the similarity problem are discussed and the approaches through dimensional analysis and differential equations of motion are described. Further investigations aiming to relate the prototype to the model are considered. (Knapp-USGS)

THE FLOOD FORECASTING BY A SERIES STORAGE TYPE MODEL,
National Research Center for Disaster Prevention, Tokyo (Japan).
M. Sugawara.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 555-560, 1969. 6 p, 10 fig.

Descriptors: *Rainfall-runoff relationships, *Mathematical models, *Surface-groundwater relationships, *Flood forecasting, Water storage, Infiltration, Hydrograph analysis, Storm runoff, Computer models.
Identifiers: Series storage models.

The series storage rainfall-runoff model is a structure composed of storage models arranged vertically in series. The storage type model is based on the hypothesis that both discharge and infiltration are functions of the amount of water stored in the ground. In the case of low rainfall, water passes through the first structure at the top of the series model and it runs off from the second or third structure with a smoothed hydrograph and time lag. Heavy rain however results in water discharging from the first structure as a flood. The discharge from the second or third structure forms the gradual fall of the hydrograph after the flood. This model seems to be useful for runoff analysis in general, including floods. A digital computer program was written to calculate numerical solutions using the series storage model. (Knapp-USGS)

THE SIGNIFICANCE OF CHARACTERISTICS OF BASIN RAINFALL AND MORPHOMETRY IN A STUDY OF FLOODS IN THE UNITED KINGDOM,
Hydrological Research Unit, Wallingford (England).
J. C. Rodda.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 834-845, 1969. 12 p, 3 fig, 3 tab, 15 ref.

Descriptors: *Rainfall-runoff relationships, *Geomorphology, *Rainfall disposition, *Distribution patterns, *Frequency analysis, Peak discharge, Rainfall intensity, Rational formula, Routing, Streamflow forecasting, Flood forecasting, Statistical methods.
Identifiers: United Kingdom.

There are various ways of predicting floods on ungaged rivers. One method is to employ a formula relating peak discharges for basins where flows are measured to the characteristics of those basins. Such a formula was devised by multiple regression analysis, using records from 26 small basins in Britain. Magnitude-frequency relations were determined for the floods in each basin and the mean annual floods were related to characteristics of basin rainfall and morphometry. The rainfall term was obtained from a countrywide study of intense rain using daily maximum falls, while basin area and drainage density were employed as the other variables. Use of all these factors in the multiple regression analysis produced the most satisfactory formula for predicting the mean annual flood. However because of the errors it involved, which were due in part to variations in geology and surface conditions, it was suggested that future studies should be based on the regional analysis approach. (Knapp-USGS)
W71-04393

DETERMINATION OF STORM RUNOFF BY THE USE OF INFILTRATION INDEX,
Ministry of Railways, Lucknow (India).
A. Bhatnagar.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 804-810, 1969. 7 p, 3 fig, 1 tab, 4 ref.

Descriptors: *Storm runoff, *Streamflow forecasting, Interception, Water storage, Infiltration, Antecedent precipitation, Rainfall, Duration curves, Discharge (Water), Hydrograph analysis, Depth-area-duration analysis.
Identifiers: India.

Storm runoff can be estimated quite accurately by an estimate of interception, retention and an infiltration index which includes other minor losses such as evaporation and transpiration. Hydrological data of 17 representative catchments in Central India were analyzed to estimate initial losses and infiltration indices occurring during storms. A coaxial relation between infiltration index, the antecedent precipitation index, storm rainfall and storm duration has also been evolved for the region. If storm duration, storm rainfall and antecedent precipitation conditions are known, the infiltration index during a storm on a catchment in this region can be determined. Storm runoff can then be estimated by subtracting initial loss and infiltration index from storm rainfall rates. (Knapp-USGS)

INTERRELATION OF RIVER WATER AND UNDERGROUND WATER DURING FLOOD PERIODS,
State Hydrological Inst., Leningrad (USSR); and Moscow State Univ. (USSR).
A. I. Chebotarev, O. V. Popov, and B. I. Koudelin.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 797-803, 1969. 7 p, 2 fig, 2 tab, 4 ref.

Descriptors: *Surface-groundwater relationships, *Bank storage, *Floods, *Base flow, Hydrogeology, Aquifers, Streamflow, Discharge (Water), Infiltration, Recharge, Water levels, Water level fluctuations, Hydrograph analysis.
Identifiers: USSR, Bank regulation.

Flood wave formation involves the interrelation of river and underground waters. Water exchange between river and river-side aquifers must be taken into consideration. In the USSR this phenomenon is generally referred to as bank regulation. It results in time redistribution of streamflow and underground river recharge, in decrease in maximum discharge, and increase in low water flow in the period between floods. The bank regulation effect is dependent on the hydrogeological structure of river valleys and on river regime. The principles of bank regulation in different hydrogeological conditions are outlined. Data characterizing the bank regulation effect under different physiographical conditions are given. (Knapp-USGS)

STATISTICAL CORRELATION OF HIMALAYAN AND BUNDELKHAND BASIN CHARACTERISTICS WITH FLOOD FLOWS,
Uttar Pradesh Irrigation Research Inst., Roorkee (India).

For primary bibliographic entry see Field 04A.
W71-04411

CONDITIONS LEADING TO THE FORMATION OF RAIN FLOOD FLOW ON SMALL RIVERS IN THE SOUTHERN PART OF THE FAR EAST,
Far Eastern Hydrometeorological Research Inst., Vladivostok (USSR).
I. N. Hartzman.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 932-940, 1969. 9 p, 2 fig, 3 ref.

Descriptors: *Rainfall-runoff relationships, *Flood routing, *Routing, Time lag, Hydrologic data, Peak discharge, Water storage, Base flow, Flood forecasting, Correlation analysis, Statistical methods.
Identifiers: USSR, Far East (USSR).

Rainfall regime of catchments were studied to make recommendations for computing the flood-forming precipitation for areas of simultaneous runoff and determining losses of rain water. Depletion of the effective basin water-storage was investigated using mass material for the conditions typical for the south of the Far East of the USSR (mountain forested catchments, plain catchments, partially marsh-ridden catchments and permafrost regions). Observations at experimental stations and in the overall network served as a basis for working out the recommendations for computing the time of travel of surface and channel flood flow in various conditions of the south of the Far East. When hydrological data were absent or insufficient, calculations of the crest and the total volume of hydrographs of rain floods for small rivers were made on the basis of the pluvial input and runoff into the channel network as well as for the flow duration of this water to the gaging section. A comparison between the computed and the observed characteristics of the flood flow shows that their agreement is sufficient for the method to be used as a basis for designing hydraulic structures. (Knapp-USGS)

TRANSFER FUNCTIONS FOR THE ANALYSIS OF RAINFALL-RUNOFF RELATIONS,
Technion-Israel Inst. of Tech., Haifa.
M. H. Diskin.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 962-971, 1969. 10 p, 3 fig, 4 ref.

Descriptors: *Rainfall-runoff relationships, *Mathematical studies, *Hydrograph analysis, *Unit hydrographs, Depth-area-duration analysis, Flood forecasting, Streamflow forecasting.
Identifiers: Transfer functions.

Rainfall-runoff relations for watersheds are usually studied by means of the convolution integral. Considering the analogy between the watershed and a lumped input-output system, the three functions that appear in the integral are the output, the input, and the impulse response functions of the system. The convolution integral is strictly applicable only if the watershed system is linear; otherwise, it may be used only in an approximate way by assuming that the response functions varies from storm to storm but remains constant during any one storm. Non-linearity of watershed systems may be studied by changes in the form of the response functions. The process of deriving the shape of the response function from rainfall and runoff records is tedious and involves trial and error methods. It is possible however to study the properties of the response function from the properties of the transfer function which is defined as the Laplace transform of the response function. In contrast to the complexity of deriving response functions, the transfer function is obtained directly from transforms of the output and input functions. The properties of transfer functions for watershed systems are discussed, and methods are given for obtaining these functions and for their use for the analysis of rainfall-runoff relations. CALCULATION AND ANALYSIS OF THE WATER BALANCE USING DATA ON PRECIPITATION AND RIVER DISCHARGE,
Institute for Geological and Geophysical Research, Belgrade (Yugoslavia).
J. Dzakovic.
Trans. From Vesnik Zavoda Za Geoloska i Geofizicka Istrazivanua, Ser B, No 8, p 123-129, 1968. Available from NTIS as TT 68-50062. Bulletin of Engineering Geology and Hydrogeology, Ser B, No 8, p 111-116, 1968. 6 p, 1 fig, 1 tab, 5 ref.

Descriptors: *Water balance, *Hydrograph analysis, *Recession curves, Streamflow forecasting, Discharge (Water), Precipitation (Atmospheric), Water storage, Groundwater movement, Hydrogeology, Water level fluctuations.
Identifiers: Groundwater balance.

Water balance calculation for the catchment area of a river uses the method of resolving sources of the river hydrograph, supplemented by the recession method. Isolating the contribution made by groundwater to the total river discharge eliminates subjective estimation of this quantity and at the same time makes it possible to give a relatively accurate estimate of the change in groundwater reserves over the period of observation. Cumulative statistical analysis of the data gives information about the quantity of water stored on the surface, primarily in the form of snow and ice. This method of obtaining quantitative estimates of groundwater and surface water is convenient for application in regional hydrogeological investigations of little-studied catchment areas. THE ENERGY BALANCE CLIMATOLOGY OF A CITY-MAN SYSTEM,
California Univ., Los Angeles. Dept. of Geography.
Werner H. Terjung.
Annals of the Association of American Geographers, Vol 60, No 3, September 1970, p 466-492. 29 fig, 6 tab.

Descriptors: *Climatology, *Weather modification, *Environment, Research and Development.
Identifiers: *Energy balance, *Micro-climatology, Radiation, City-man system, Metropolitan Areas.

The urban energy balance climatology of the city and man in the Los Angeles basin was examined during a cloudy day ('Catalina eddy') in September 1968, from about sunrise to sunset, by measuring or estimating solar radiation, net radiation, ground heat flux, actual surface temperature, terrain radiant temperature, radiant sky temperature, and dry and wet-bulb temperature for the physical urban interface. An analagous theoretical model attempted to define the input of energy to the human interface via the solar heat load, and the disposal of human net radiation was shown via the channels of latent, sensible, and body heat flux. In spite of an apparent uniform cloud cover, the energy parameters has considerable areal variation in intensity and trend. During the daylight hours 70% of solar radiation was absorbed. An additional 32% was removed by longwave radiation. Of the net radiation received on the dry surface (47% of solar radiation), about 80% was disposed via sensible heat flux, and the remainder entered the pavement as storage. Air temperatures taken at shelter height were out of phase with the ongoing energy regime and were deemed of dubious value in urban climatic studies. Urban man received only 37% and 70% of the values available at the horizontal pavement for solar radiation and net radiation, respectively. A series of empirical and theoretical models show high correlations with the observations. It appeared that solar radiation and net radiation (physical and human) could have been estimated via the solar constant and appropriate transmissivities. (Wray-Chicago)

IEW OF WATER RESOURCES OF THE AREA, NORTHERN ALASKA,
cal Survey, Washington, D.C.
Williams.
cal Survey Circular 636, 1970. 8 p, 2 fig, 2 ref.

tors: *Water resources, *Alaska, *Surface *Groundwater, *Water quality, Stream- easonal, Ice, Permafrost, Frozen soils, ground, Aquifers, Water yield, Hydrologic roundwater movement, Alluvium, Hydrolo- gs, Storage, Recharge.
rs: *Umiat area (Northern Alaska).

In the Umiat area of northern Alaska, surface-water supplied from the Colville River, small tributary creeks, and lakes are abundant in summer but limited in winter by low or zero flow in streams and thick ice cover on lakes. Fresh groundwater occurs in unfrozen zones in alluvium and in the upper part of bedrock beneath the Colville River and beneath lakes that do not freeze to the bottom in winter. Brackish or saline groundwater occurs in bedrock beneath as much as 1,055 feet of permafrost in the Arctic foothills and beneath 750 to 800 feet of permfrost beneath low terraces of the Colville River valley. The foothill area is unfavorable for developing supplies of potable groundwater because of the great depth to water, predominance of brackish or saline water, and low potential yield of the bedrock. In the Colville River valley, shallow unfrozen alluvium beneath the river and deep lakes will yield abundant year-round supplies of groundwater, but the bedrock below permafrost yields less than 10 gallons per minute of saline or brackish water. Descriptors: *Snow surveys, *Nuclear moisture meters, *Water equivalent, *Gamma rays, Snow cover, Water yield, Snowpacks, Calibrations, Snow management, Runoff forecasting, Streamflow forecasting.
Identifiers: *Norway, *Nuclear water-equivalent meters (Snow).

Gamma rays emitted from naturally occurring radioactive elements in the ground are used to measure continuously the water equivalent of snow deposits along selected routes in typical mountain and lowland areas in Norway. The activity measurements have been made from snow scooters and from helicopters flying about 5 and 20 m above ground level. Snow deposits equivalent to 0 - 30 cm of water are measured with an accuracy better than 10% standard deviation as compared with a series of conventional gravimetric measurements. The method is to be applicable to measurements of snow deposits equivalent to 0 - 60 cm of water. An empirical formula is given for computer calculation of snow deposits by this method. The formula is valid for measurements of snow deposits through the winter season. (Knapp-USGS)

In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/28, p 479-482, 1970. 4 p, 2 fig, 3 ref.

Descriptors: *Tracers, *Radioisotopes, *Chromium, *Discharge measurement, *Ice, Streamflow, Stream gages, Velocity, Regime, Discharge (Water), Mixing, Radioactivity techniques.
Identifiers: *Iced rivers.

Time of travel and discharge measurements were made in frozen rivers by means of radioactive tracing. The measurements were made with Cr-51 in two frozen rivers of north Moravia, Czechoslovakia, in 1969. The application of the isotope technique on the time of travel measurement in frozen rivers was considered to be a satisfactory method. The movement of water particles was found to be faster in a channel covered by ice than in a free surface channel when other hydraulic conditions remained unchanged. (Knapp-USGS)

Journal of Geophysical Research, Vol 76, No 3, p 657-665, January 20, 1971. 9 p, 5 fig, 15 ref. HEW-NCAPC Grant AP 0049.

Descriptors: *Fog, *Freezing, *Nucleation, *Cooling, *Ice, Alaska, Crystal growth, Cloud physics, Meteorology, Aerosols, Particle size.
Identifiers: *Ice fog.

A mechanism is proposed for the formation of ice fog particles in the city and environs of Fairbanks, Alaska. Equations are developed for calculating the size distribution resulting from growth by deposition of water vapor. The equations are numerically solved with a computer for three major types of ice fog sources: (1) automobile exhaust, (2) exhaust from heating plants, and (3) open water. The size distribution produced by an individual source is determined by the cooling of water vapor injected into the environment. The cooling rate is a function of the source characteristics and the ambient temperature. The proposed mechanism adequately represents the observed size distribution if the cooling rate of the water vapor injected into the environment is not too large (source types 2 and 3). Because of the large cooling rate of the water vapor injected into the atmosphere by source type 1, the size distribution from this source is not adequately represented by the model. In agreement with observations, the computational results predict a decrease in the size of ice fog particles with decreasing ambient temperature for source types 2 and 3. (Knapp-USGS)

TRITIUM AND OXYGEN-18 IN NATURAL WATER SAMPLES FROM SWITZERLAND,
Bern Univ. (Switzerland); and Pisa Univ. (Italy).
U. Siegenthaler, H. Oeschger, and E. Tongiorgi.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No Sm-129/22, p 373-385, 1970. 13 p, 10 fig, 16 ref.

Descriptors: *Tritium, *Oxygen, *Hydrogeology, *Radioactive dating, Groundwater movement, Recharge, Discharge (Water), Water balance, Precipitation (Atmospheric), Altitude, Mountains, Lakes, Streamflow, Water sources, Mixing, Surface-groundwater relationships.
Identifiers: *Switzerland, *Alps, *Oxygen isotopes.

Tritium and O-18 concentrations were measured in precipitation samples at various stations in the Alps, in the foothills of the Alps and the Jura region. Mean O-18 concentration and mean annual temperature follow a linear relationship at many, but not all, of the considered stations. The O-18 to altitude relationship varies between different regions. The O-18 and tritium contents in precipitation are used as a basis for interpreting the T/H- and O-18/O-16 ratios observed in rivers and underground waters. A spring in the Alps shows no seasonal variations in either tritium or O-18. O-18 provides information about the mean altitude of its recharge area whereas tritium values allow the computation of the mean residence time of the water in the ground. The isotopic behavior of different inputs (precipitation, lake and river water) to the groundwater downstream from the lake of Thun was investigated. Distinct tritium variations occur with a sharp maximum in winter. This cannot be due to delayed rain from the preceding summer, since O-18 is constant with time. The variations can be explained by assuming several well-mixed reservoirs of different ages with a mixing ratio varying with time. The isotopic compositions of the considered underground waters support the assumption that groundwater recharge occurs uniformly during all seasons. (Knapp-USGS)

Identifiers: Ontario, Canada.

Part of the Canadian IHD Programme was intended to develop a standard method of computing the peak rate of runoff corresponding to a selected probability, for drainage basins in the area range of ten to one hundred and fifty square miles. The physical factors thought to have a major effect on the lag time, here defined as the time interval from the midpoint of the excess rain to the center of gravity of runoff, were combined into an equation. Records of a number of isolated storms from each of a dozen drainage basins were analyzed and the actual lag times compared with those indicated by the equation. The final equation, with exponents adjusted, gives lag time in terms of area, shape factor, equivalent slope, storage factor and population factor. (Knapp-USGS)

Identifiers: Mean annual flood, Mean discharge, Turkey.

In Turkey, where a variety of climates and physiographic features exists, a network of stream-gaging stations is not yet developed to give a good picture of changes in streamflow, especially of maximum discharges, both in time and space. An attempt is made to approximate mean maximum discharges using average streamflow discharges as an index. The ratio of the mean maximum discharge to average discharge at long-term stations shows a regional variation, almost independent of the size of drainage area. Accordingly, at points, gaged or ungaged, for which recorded or estimated average discharges are available, mean maximum discharge can be estimated. (Knapp-USGS)

STAGE AND FREQUENCY OF FLOODS IN CENTRAL INDIA,
Ministry of Railways, Lucknow (India).
A. Bhatnagar.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 925-932, 1969. 8 p, 5 fig, 4 ref.

Descriptors: *Stage-discharge relations, *Frequency analysis, *Floods, *Flood forecasting, *Peak discharge, Statistical methods, Data collections.
Identifiers: India.

Annual flood stages at 20 railway bridges with catchment areas varying from 800 sq km to 29,000 sq km in Central India were analyzed to evolve regional stage-frequency relations. A dimensionless regional frequency curve was evolved correlating annual flood stages expressed as a ratio to mean annual flood stage along with the relation of mean annual stage to catchment area. With the help of these two curves momentary peak flood stage for any design frequency can be determined for any catchment in this region. From the second curve the mean annual stage corresponding to the catchment area is determined. This, when multiplied by the ratio of the annual flood stage to the mean annual flood stage for the design frequency, obtained from the first curve, gives the required annual flood stage. Identifiers: *Columbia River, *Eddy Diffusion coefficients, *Longitudinal and Lateral diffusion, Effluent buoyancy.

The area of the Columbia River between miles 383 and 355 has been used by the Atomic Energy Commission and no less than five plutonium-producing and power-producing reactor complexes have been sited on these waters. The purpose of this report is to determine the lateral and longitudinal eddy diffusion coefficients for this section of the river. The techniques employed include both remote sensing systems and physical contact sampling systems. Dye is used as a tracer in both techniques. An empirical examination of the effect of affluent buoyancy on the lateral dispersion coefficient is presented. Results indicate that the lateral diffusion coefficient depends upon density differentials. Values for the longitudinal diffusion coefficient generally range between 500 sq ft./sec and 3000 sq ft./sec for flow rates of 80,000 to 130,000 cu ft./sec. (Herrera-Vanderbilt)

WATER SURFACE CONFIGURATION IN CHANNEL BENDS,
Howard Univ., Washington, D.C. Dept. of Civil Engineering; and Illinois Univ., Urbana. Dept. of Civil Engineering.
Chin-lien Yen, and Ben Chie Yen.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY2, Paper 7928, p 303-321, February 1971. 19 p, 8 fig, 9 ref, append.

Descriptors: *Open channel flow, *Flow profiles, *Meanders, *Channel morphology, Hydraulics, River training, Mathematical studies, Reynolds number, Turbulent flow, Steady flow, Water levels.

Water surface configuration in open-channel bends depends on the geometry of the channel. Mathematical expressions for longitudinal and transverse water surface profiles are derived from the equations of motion with the aid of order of magnitude analysis. Computed surface profiles and superelevation obtained by using mathematical expressions agree well with experimental measurements of subcritical flows in trapezoidal and natural bed meandering models. The result reveals that the channel bed topography is an important factor in determining the superelevation and water surface profiles. Inadequacy of conventional approximate methods to evaluate the superelevation is also examined. (Knapp-USGS)

Identifiers: *Bromine radioisotopes, *Danube River.

The measurement of flow rate in rivers which may undergo marked seasonal changes in depth is highly important both for navigation and for the operation of hydraulic power plants. Nuclear methods, which are known to give very good results in smaller rivers, were applied to larger streams. By contract of the company operating a chain of power stations along the Austrian part of the Danube, dispersion and flow rate measurements with radioactive tracers were carried out in the reach between Aschach and Linz. In this zone, flow rates between 1000 and 7000 cu m/sec may be expected. A combined method of total count and total sample was applied using Br-32 as the tracer. Samples as well as direct measurements were taken simultaneously at various depths from three boats across the river. (Knapp-USGS)

Identifiers: *Danube River.

Systematic tracer investigations of the Danube were made to determine the changes in hydrodynamic, hydrochemical and hydrobiotical properties of the river and to determine increased accumulation of waste material. Radioactive tracers were used to study the dispersion characteristics of the river in different hydrological conditions within the experimental zone of twenty-five kilometers. The properties of the water and suspended material were investigated by neutron activation analysis, and the accumulation of radioactive pollutants in different components of the ecosystem were also studied. Vertical mixing was attained after two kilometers and lateral distribution of radioactive tracer was still not complete eighteen kilometers downstream from the injection point. Twelve kilometers downstream from the injection point, the diffusion coefficients reach a constant value. The maximum concentrations of injected radioactive tracer decrease exponentially along the river course. Radioecological studies by gamma spectrometry show that, in addition to fallout activity, gamma emitting nuclides characteristic of corrosion products are present. (Knapp-USGS)

MECHANICAL COMPACTION OF SANDS CONTAINING DIFFERENT PERCENTAGES OF DUCTILE GRAINS: A THEORETICAL APPROACH,
Shell Oil Co., Houston, Tex.
Gordon Rittenhouse.
American Association of Petroleum Geologists Bulletin, Vol 55, No 1, p 92-96, January 1971. 5 p, 4 fig, 8 ref.

Descriptors: *Porosity, *Pores, *Interstices, *Diagenesis, *Ductility, Compressibility, Plasticity, Sandstones, Permeability, Groundwater movement, Porous media, Void ratio, Voids, Solubility, Sediments, Sedimentary petrology, Sedimentary rocks.
Identifiers: Pore-space, Cementation, Compaction.

The reduction in pore space and thickness caused by plastic deformation of grains has been calculated for different proportions of ductile and nonductile, uniformly sized spheres in orthorhombic packing and for other shapes of grains. The relation for uniformly sized spheres in orthorhombic packing is believed to be applicable to well-sorted and rounded natural sands in which compaction has been extensive, and to be a maximum for angular sands or for very well-sorted and extremely well-sorted, well-rounded sands. Applicability to less well-sorted sands is less certain. In sands in which such plastic deformation has not been complete, less reduction in pore space or thickness may be expected. These relations may be helpful in separating the effects of plastic deformation of grains from those caused by grain rotation of fracturing, solution from points of grain contact, and cementation. Experimental investigation of the relation of ductile grain content to reduction in pore space or thickness is considered desirable. (Knapp-USGS)

PORE-SPACE REDUCTION BY SOLUTION AND CEMENTATION,
Shell Oil Co., Houston, Tex.
Gordon Rittenhouse.
American Association of Petroleum Geologists Bulletin, Vol 55, No 1, p 80-91, January 1971. 12 p, 9 fig, 9 ref, append.

Descriptors: *Porosity, *Pores, *Interstices, *Diagenesia, *Sandstones, Permeability, Groundwater movement, Porous media, Void ratio, Voids, Solubility, Sediments, Sedimentary petrology, Sedimentary rocks.
Identifiers: Pore-space, Cementation, Compaction.

The amount of pore-space reduction caused by solution of grains at points of contact and the additional reduction that would result from precipitation of this dissolved material was investigated. For single grains and their associated pore space such reduction in porosity was calculated for spheres and other geometric forms in various packing arrangements. The relative amounts of porosity reduction may vary greatly, depending on grain shape and angularity, packing, direction of pressure, and amount of solution. The maximum porosity loss by cement relative to porosity loss by solution occurred with spheres in orthorhombic packing, rotated 30 deg. This is believed to be a maximum for any sand and most closely approached by a well-sorted sandstone made up of very well-rounded grains. A maximum cement-to-solution relation is estimated for sandstones of better or poorer sorting or greater grain angularity. The extrapolation from single grains and their associated pores to sandstones is complicated by the possibility of nonuniform solution or cementation. (Knapp-USGS)

RELIABILITY OF CARBON-14 DATING OF GROUNDWATER: EFFECT OF CARBONATE EXCHANGE,
Heidelberg Univ. (West Germany).
L. Thilo, and K. O. Munnich.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No Sm-129/17, p 259-270, 1970. 12 p, 7 fig, 1 tab, 8 ref. IAEC Contract 215/RB.

Descriptors: *Carbon radioisotopes, *Radioactive dating, *Groundwater movement, *Ion exchange, Carbonates, Carbonate rocks, Soil chemistry, Water chemistry, Leaching, Limestones, Recharge, Discharge (Water), Water circulation, Carbon dioxide, Mixing, Tritium.
Identifiers: *Radiocarbon dating (Groundwater), Groundwater dating.

Carbonate exchange was investigated by measuring the flow of a C-14 spiked carbonate solution through columns of a number of different calcareous materials. A reversible exchange was clearly observed by a delay of the C-14 tracer compared with the carrier solution. The extent of this delay amounts to an exchange which is restricted to somewhat less than one molecular layer on the surface of the solid phase. The exchange time is less than about 2 hours. The influence of such an exchange on the C-14 dating of groundwater is limited and can be estimated fairly accurately if the grain size and the relative carbonate concentrations of the aquifer are known. An additional irreversible carbonate exchange was shown by larger and permanent losses of C-14 from the liquid phase, especially at higher temperatures. The perature dependence for this process was meas and, when extrapolated, pointed to signif losses of C-14 at 10 deg C within time inte comparable to the lifetime of C-14. A compa between the concentration of bomb-produce 14 in the atmosphere with the concentration subsequently appears in a shallow aquifer, sh no clear evidence of carbonate exchange. (Kn USGS)

The expected age distribution of water in diff types of aquifers with primary and secon permeability is discussed and examples given markably uniform flow is sometimes observed distances of several kilometers with secon permeability, and average flow rates ca deduced even where the strata are too hetero ous to apply pumping tests. The apparent a spring water emerging from an unconfined aq as calculated from the C-14 or tritium con can be used to calculate the average age o water in the aquifer and thence the rate of rec and storage capacity. Such apparent ages pro means of directly comparing tritium and C-14 The initial C-14 content of groundwater is fou be about 85% of the modern value in both h and arid climatic regions. The magitude of a p ble loss of C-14 from the groundwater by is exchange with solid carbonate appears to be tively small in practice and C-14 ages are pro no more than 20 to 30% too high, even unde favorable conditions. nt artificial variations in atmospheric carbon contents are used in the evaluation of velocities in young groundwater systems. t age determinations are possible if a periodic ling program is established. The changing carbon concentrations of the groundwater nate species, after correction for limestone on, can be fitted to known excesses in plants the past two decades. Three aquifers have studied by this technique. Four annual lings are shown for the Lake of Valencia and arquisimeto groundwaters in Venezuela, and samplings for the Koln 07 system in the al Republic of Germany. The best fit is ob- for Barquisimeto, where groups of data from wells along the aquifer axis were used in the ation of a flow velocity of 100 meters per The well closest to the outcrop produces with an apparent age of 3.5 years and the last 10.5 years. Tritium contents, which were ired in the Koln 07 series, are not in good ment with the radiocarbon values. (Kanpp-)

CARBON AND OXYGEN ISOTOPES TURAL WATERS IN THE NETHER-

n Rijksuniversiteit (Netherlands).
W. G. Mook.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No Sm-129/12, p 163-190, 1970. 28 p, 15 fig, 4 tab, 21 ref.

Descriptors: *Stable isotopes, *Carbon, *Oxygen, *Water chemistry, Water balance, Groundwater, Surface waters, Sea water, Water sources, Hydrologic cycle, Evaporation, Precipitation (Atmospheric), Estuaries, Mixing, Carbonates, Water temperature.
Identifiers: *The Netherlands.

The carbon and oxygen isotopes in the Dutch surface water and groundwater present an internally consistent picture of the hydrologic cycle. The O-18 content of the average annual precipitation is -7.9 parts per thousand. The groundwater generally reflects the isotopic composition of precipitation during the seasons of maximum infiltration. River water appears to have a component derived from groundwater. The C-13 of the dissolved bicarbonate generally varies between -12 and -8 parts per thousand, largely due to isotope exchange with the atmospheric CO2. Rivers supplied by meltwater and rainwater show opposite variations in O-18 content, the Rhine from -9 to -10 parts per thousand and the Vecht from -7.5 to -6.5 parts per thousand between winter and summer respectively. In an estuary the isotopic compositions of the bicarbonate and the water turn out to be solely determined by the mixing ratio of the fresh and sea water. The O-18 chlorinity relation yields a straight line, whereas the similar relation for C-13 gives a smooth curve, the form depending on the relative quantities of dissolved carbon in the fresh and sea water. In the lake Ijsselmeer the C-13 content approaches an isotopic equilibrium with atmospheric CO2 along the flow direction, due to the relatively long residence time of the water in the lake. (Knapp-USGS)

In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/18, p 271-286, 1970. 16 p, 4 fig, 1 tab, 15 ref.

Descriptors: *Radioactive dating, *Groundwater, *Water chemistry, *Carbonates, Chemical reactions, Solubility, Aqueous solutions, Leaching, Ion exchange, Carbon radioisotopes, Stable isotopes.
Identifiers: *Carbon-14 dating, *Carbon isotopes, *Carbon isotope ratios.

The sources of dissolved carbonate species in groundwater systems must be known in order to correct C-14 measurements to determine true or to correct relative groundwater ages. The contributions of the various sources can be estimated from C-13/C-12 ratios and from total carbonate content measurements on the water. Atmospheric precipitation generally contains no dissolved carbonate; the initial carbonate dissolved in groundwater comes from the soil atmosphere and soil carbonate minerals. Theoretical considerations and field studies in Florida, New York, and Texas show that carbonate dissolved from the soil air has values of delta C-13 of about (-) 25 parts per thousand, and the C-14 value is about the same as recent values; these are identical with those of plants. The major source of additional carbonate in deeper parts of a groundwater system is solution of carbonate minerals. In nearly pure carbonate systems, such as the principal Floridan aquifer, this solution about doubles the content of dissolved carbonate species, and delta C-13 is about 1.2% and true C-14 is about twice that measured. Where ionic interaction is affected by silicate dissolution, cation exchange, or mixing of dissimilar waters, the dissolved carbonate content can increase further. Several no non-mineral sources may also add dissolved carbonate to groundwater. Isotope exchange theoretically could change the ratios, but field studies show no evidence that exchange occurs in the temperature range of most groundwaters. (Knapp-USGS)

GROUNDWATER MEASUREMENTS AT THE SITE OF THE SYLVENSTEIN DAM IN THE BAVARIAN ALPS,
Gesellschaft fuer Strahlenforschung m.b.H., Munich (West Germany). Institut fuer Radiohydrometrie.
W. Drost.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/25, p 421-437, 1970. 17 p, 14 fig, 1 tab, 8 ref.

Descriptors: *Radioisotopes, *Stable isotopes, *Tracers, *Reservoir leakage, Grouting, Deuterium, Seepage, Oxygen, Water loss, Groundwater movement, Tracking techniques, Water temperature, Sampling, Flow, Porous media, Nuclear moisture meters, Radioactivity techniques.
Identifiers: *Alps, *Bavaria, *Oxygen isotopes.

At the site of the Sylvenstein dam in the Bavarian Alps, 14 series of groundwater measurements were made between 1961 and 1969 to determine seepage rates and seepage paths through the grout curtain of the gravel-filled dam. Borehole dilution techniques, temperature measurements, and D- and O-18 measurements were carried out. Measurements were made at 50 groundwater points in front of and behind the grout curtain. Taking the average flow line density to calculate seepage rate, a mean value of 50 liters/sec was derived. This seepage rate did not vary during the observation period and is considerably lower than the original groundwater flow of 150 liters/sec. (Knapp-USGS)

BROMIDE AND IODIDE IN OILFIELD BRINES IN SOME TERTIARY AND CRETACEOUS FORMATIONS IN MISSISSIPPI AND ALABAMA,
Bureau of Mines, Bartlesville, Okla. Bartlesville Petroleum Research Center.
A. Gene Collins, William P. Zelinski, and Cynthia A. Pearson.
Bureau of Mines Report of Investigations 6959, June 1967. 27 p, 1 fig, 3 tab, 52 ref.

Descriptors: *Groundwater, *Oil fields, *Chemical analysis, *Halogens, *Chemical reactions, Geochemistry, Brines, Mississippi, Alabama, Geology, Water, Oil, Petrology, Chlorides, Sedimentary petrology, Rocks, Geologic formations, Sampling, Data collections, Sediments, Tertiary period.
Identifiers: *Oilfield brines, (Ala. and Miss.), Bromide, Iodide, Cretaceous formation.

The Bureau of Mines investigated the bromide and iodide content of Mississippi and Alabama oilfield

waters of the Tertiary and Cretaceous period to determine genetic relationships of the ions, to determine their origin, and to determine their genetic relation to petroleum. The 280 samples were analyzed after a pretreatment to remove interferences. The iodide was oxidized to iodate and was titrated with thiosulfate. The bromide was oxidized to bromate and was determined iodometrically. A computer was used to calculate the correlation coefficients of iodide to bromide and to other ions. The other ions are sodium plus potassium, calcium, magnesium, chloride, bicarbonate, and sulfate. The mineral content of the samples ranged from 52 to 1,760 mg/liter for bromide and from 2 to 65 mg/liter for iodide. The mean bromide-to-chloride and iodide-to-chloride ratios were 0.0065 and 0.0002. The correlation coefficient matrix and linear plots indicated a definite bromide-to-calcium relationship for the brines investigated. (Woodard-USGS)

Identifiers: Aquifer models, Aquifer simulation.

There is a tendency during the verification stage of aquifer model building to manipulate stratigraphic boundaries. This procedure is acceptable insofar as the geohydrologist is sufficiently knowledgeable to sense the point at which the manipulations encroach upon the integrity of his model. Examples from the Maryland Coastal Plain are used to depict several types of stratigraphic boundaries. These include erosional truncation, overlap (or pinchout), disconformity, and facies change. Defining statements are given for each in order to clarify the stratigraphic implications of boundary modeling. (Knapp-USGS)

Identifiers: *Groundwater dispersion, *Aquifer tests, *Aquifer evaluation, *Pumping tests.

Theoretical problems of the two-well and multi-well tracer techniques generally used for measurements of natural groundwater velocities are discussed. Analytical solutions are given for different measurement geometries. For a point injection and a line injection in an infinite medium, theoretical breakthrough curves are given graphically in a normalized form. They allow estimation of the amount of tracer or carrier needed. They can also be used to find the appropriate transit time and dispersion coefficient from the measured breakthrough curves. Approximate analytical solutions for radial flow are also given graphically. All the formulas are valid for any value of the dis sionless dispersion parameter. Comparison o theoretical solutions with several experim shows their applicability. For planning a field periment the dispersion parameter has to known; therefore, existing theoretical, labora and field data on dispersion coefficients were c piled and are given in a comprehensive form napp-USGS)

Descriptors: *Tracers, *Radioactive well log *Groundwater movement, Hydrogeol Aquifers, On-site tests, Tracking techniq Borehole geophysics, Tagging, Sampling.
Identifiers: *Aquifer testing.

A tracer method for aquifer testing is based on simultaneous labelling of the whole colum water in the borehole and the immediate stud its behavior. The probes used were enclosed in ries of tubes in which perforations cover a kn percentage of their lateral surface. If no ver flow exists, the horizontal velocity can be m sured. The presence of turbulent vertical results in the progressive disappearance of tracer from the area in which the flow origin towards the area of horizontal displacement. In case of aquifers in limestone or other hard for tions, this technique makes it possible to pinp the fissures through which the water circulates. principal advantages of this method are: (a) ra ty in obtaining results; (b) simultaneous suppl information over all the piezometric column; (c) simplicity. This technique, used repeatedl studies of underground water carried out at var points in Spain, including the Costa del Sol, yi qualitative and quantitative information ab characteristics of the aquifers. Its use prior to o more complete but slower and more co methods can give results which make it possibl orientate subsequent work in the most us direction. (Knapp-USGS)

The hydrogeology of a karstic region of the ou Dinarides in Yugoslavia, which includes groundwater divide of the drainage basins of rivers Cetina and Neretva and the direct drain basin of the Adriatic Sea, is described with part lar reference to the relationships between perm ble and impermeable rocks. The lithology and tectonics of the area, hydrogeological geomorphological phenomena associated with flow of groundwater, and the hydrogeology and

ctions of flow of groundwater are reviewed. (K-p-USGS)

Water in Soils

LABLE MOISTURE STORAGE CAPACI-OF SOME LIMESTONE DERIVED SOILS,
uri Univ., Columbia.
Andrew Ruppert.
Thesis, Missouri University Graduate School, y 1970. 110 p, 33 fig, 11 tab, 38 ref, 3 ap-OWRR Project B-022-MO (1).

ptors: *Soil moisture, *Soil structure, *Soil-plant relationships, *Limestones, *Soil water ent, Soil types, Storage capacity, Clays, Soil ties, Porosity, Soil tests, Soil surfaces, tion effects, Infiltration, Earth-water inter-Soil compaction.
iers: *Limestone-derived soils.

noisture storage capacities of limestone d soils were studied in relation to the depths onate rock. The major site picked for this vas an area in Missouri where depth to car- rock decreased with distance, and where, at cal depth to bedrock, a natural boundary n forest and prairie vegetation existed. The ere characterized in order to establish their ty to limestone derived soils previously stu-he available moisture storage capacities of oils were determined in order to observe the s in available moisture storage capacity as-d with varying depths to carbonate rock. The consumptive demand for moisture was estimated at the soil sites in order to test the hypothesis that periods of drought existed in the shallower soils while the deeper soils were able to supply moisture throughout the growing season. A vegetative survey was made in order to relate the vegetative pattern to the depths to bedrock, the available moisture storage capacities, and the consumptive moisture demand. As the depth to carbonate rock varies from 10-50 inches the maximum bulk density of the soil profile increases from 0.8 to 1.5 g/cc. (Woodward-USGS)

STUDY OF A DOLOMITIC AQUIFER WITH CARBON-14 AND TRITIUM,
Department of Water Affairs, Pretoria (South Africa); and Council for Scientific and Industrial Research, Pretoria (South Africa). National Physical Research Lab.
D. B. Bredenkamp, and J. C. Vogel.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No Sm-129/21, p 349-372, 1970. 24 p, 8 fig, 5 tab, 11 ref.

Descriptors: *Carbon radioisotopes, *Tritium, *Tracers, *Radioactive dating, *Groundwater movement, Hydrogeology, Water storage, Recharge, Discharge (Water), Springs, Aquifers, Water balance, Transmissivity, Carbonates, Carbonate rocks, Dolomite.
Identifiers: *Transvaal (S. Africa).

The Dolomite Series which outcrops over an extensive area of the Transvaal is frequently subdivided into separate groundwater compartments by vertical diabase dykes to form well-defined aquifers which usually overflow in strong springs at the lowest point on the surface. The hydrology of one such compartment was analyzed to provide figures for the aquifer characteristics which can be compared with the results of isotope data. The recharge rate of the aquifer is 17.7 mm/yr and the storage capacity is about 57 times the annual recharge. The initial C-14 content of the groundwater varies from 80 to 90% with the result that this isotope is relatively unsuitable for quantitative deductions. Both C-14 and tritium show a linear increase in age with depth in accordance with the theory. From the tritium results a recharge rate of 11.5 mm/yr, and a storage capacity of 106 times the annual recharge are deduced. Practically the same results are obtained from the tritium content of the spring water if the initial tritium content of the recharge, extrapolated from the age-depth curve (7 TU), is used and the relationship between average age and apparent age of the discharge employed. (Knapp-USGS)

CARBON-14 CONCENTRATION OF LIME IN SOILS AND ASPECTS OF THE CARBON-14 DATING OF GROUNDWATER,
Niedersaechsisches Landesamt fuer Bodenforschung, Hanover (West Germany).
M. A. Gehy.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/14, p 215-223, 1970. 9 p, 1 fig, 2 tab, 15 ref.

Descriptors: *Carbon radioisotopes, *Groundwater, *Radioactive dating, *Soil water, Soil water movement, Soil chemistry, Water chemistry, Infiltration, Water circulation, Recharge, Carbonates, Leaching, Carbon dioxide, Mixing.
Identifiers: *Groundwater dating, *Radiocarbon dating (Groundwater).

Carbon-14 age determinations of groundwater are based on the assumption that the soil lime which is dissolved during the passing of CO2-containing rain water is free of radiocarbon. In contrast to this the results of the C-14 determinations from recent groundwaters do not agree with the theoretical values of the dilution factor determined from the content of free and fixed carbonate species of the groundwater. In all cases the mean C-14 concentration of the groundwater was higher than expected in theory even if corrections of an improved water dating model have been used. Measurements of the C-14 concentration of more than ten different soils show that the basic assumption is not correct. The carbonate in the uppermost layer of the soil have a C-14 content between 2 and 70% modern, normally lying within a range of 2 to 15% modern. It is supposed that this radiocarbon is accumulated during the summer with its low recharge rate by precipitation of lime when the water in the uppermost layer is evaporated. During the time of highest groundwater recharge this lime will be dissolved by the leak water and transported to the aquifer. On the supposition that such or a similar process corresponds to the common mechanism in nature, the calculations show that the previously measured C-14 concentrations of recent groundwaters are in accordance with the theoretical values. THE ROUTINE ESTIMATION OF SOIL MOISTURE DEFICITS,
British Meteorological Office, Bracknell (England).
J. Grindley, and F. Singleton.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 811-820, 1969. 10 p, 4 fig, 7 tab, 6 ref.

Descriptors: *Soil moisture, *Moisture content, *Water supply, *Flood forecasting, *Evapotranspiration, Water balance, Infiltration, Antecedent precipitation, Effective precipitation, Storm runoff, Streamflow forecasting, Mapping.
Identifiers: Soil moisture deficit, United Kingdom.

Since the autumn of 1962 the United Kingdom Meteorological Office has issued maps of estimated soil moisture deficit to authorities concerned with flood warning and water supply. The method of estimation is to assume a zero deficit during the late winter and thereafter to calculate the cumulative effect of rainfall minus evaporation. Assessment of evaporation is made using a shortened version of Penman's formula. Allowance is made for the inhibition of evaporation from vegetation when soil moisture deficits are large, and the variation of this effect with root length. When considered important, maps of effective precipitation are also issued. Effective precipitation during a period is defined as the excess precipitation over and above that needed to make good the soil moisture deficit which existed at the beginning of the period, with allowance being made for evaporation. Examples of both types of map are shown and their use to river authorities is discussed. (Knapp-USGS)

USE OF GAMMA EMISSION FROM AMERICUM-241 TO MEASURE THE WATER CONTENT OF NONSATURATED SOIL SAMPLES (FRENCH),
Grenoble Univ. (France). Laboratoires de Mecanique des Fluides.

G. Vachund, J. Cisler, J. L. Thony, and L. de Backer.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/39, p 643-661, 1970. 19 p, 8 fig, 2 tab, 16 ref.

Descriptors: *Nuclear moisture meters, *Soil moisture meters, *Gamma rays, Calibrations, Instrumentation, Soil moisture, Soil water, Moisture meters, Nuclear meters, Radioactivity techniques.
Identifiers: *Nuclear soil moisture meters.

Because americium-241 has a narrow, well-defined main peak corresponding to the emission of a 60-keV gamma ray, it is very useful for soil water measurements by the gamma-attenuation method, the main advantage being the thinness of the shield needed to protect the source. The gamma radiation emitted by a 0.1-Ci source is collimated into a beam 4 mm in diameter. The source-detector assembly can be moved so as to permit surveying of the sample in a vertical plane. By making a depression at the base of the sample it can be saturated or desaturated, and the changes in water content between the two states of equilibrium can be followed by the gamma-attenuation method. For the measurement geometry used in the tests described, the mass attenuation coefficient of the water is only 0.1788 g/ sq cm, its theoretical value being 0.204. Improved collimation gives 0.1998 g/ sq cm. The results obtained with moderate collimation can be very accurate, provided that the corresponding value of the attenuation coefficients is carefully determined. (Knapp-USGS)

Descriptors: *Soil water movement, *Soil moisture meters, *Tensiometers, *Water balance, Evapotranspiration, Instrumentation, Soil moisture, Nuclear moisture meters, Hydraulic conductivity, On-site tests, Consumptive use.
Identifiers: *Soil water flowmeters, *Soil densitometers.

By means of a double-probe densitometer and a tensiometer, variations in the soil water content and soil moisture suctions may be determined as a function of time in different horizons of a soil profile. From these data are computed the water flow, evapotranspiration, and exchange of moisture between the soil and groundwater zones. By including the precipitation, the essential components of the water balance equation are measured. In addition, it is possible to obtain from the field measurements the relations between soil water suction and hydraulic conductivity for the individual horizons of a profile. (Knapp-USGS)

Descriptors: *Deuterium, *Oxygen, *Stable isotopes, *Lakes, *Water balance, Evaporation, Inflow, Streamflow, Precipitation (Atmospheric), Hydrogeology, Sampling, Arid lands, Climates, Water chemistry, Water temperature.
Identifiers: *Lake Chad, *Oxygen isotopes.

Lake Chad is a water body, without outlet, of approximately 20,000 sq km in the heart of tropical Africa. In this semi-arid zone with a climate ranging from the western-Sahara to the sub-desert type, the high rate of evaporation (over 2 m per year) gives rise to an extensive isotopic tracing effect in the surface waters. The proportions and nature of the hydrogeological problems of this internal drainage basin of more than 2 million sq km provide justification for the use of isotope techniques. Four pluviometric stations situated at the north and south of the lake provide a means for evaluating the weighted mean isotopic composition of rainfall on the lake. Weekly sampling and gaging carried out on the Chari River (accounting for 94% of the inflow from rivers) indicates an annual isotopic modulus of -3.3 parts per thousand O-18 vs SMOW in 1967 and-2.8 parts per thousand in 1969. The heavy isotope content increases with distance from the mouth of the Chari. The increase amounts to 20 parts per thousand in oxygen-18 and 110 parts per thousand in deuterium in the isolated branches of the northeast shore. However, the enrichment varies with time, as a function of the inflow conditions and the various climatic parameters, and affords a means of defining two areas of evolution in the lake. The influence of the evaporation enriched waters of the lake is very distinct in the fringe of groundwater near the shore but further inland it disappears. (Knapp-USGS)

PEOPLE EX REL CARLSTROM V HATCH (OWNERSHIP OF MARSH MEANDERED AS A LAKE).

350 Ill 586, 183 NE 610-613 (1932).

Descriptors: *Illinois, *Land tenure, *Prescrip rights, *Meanders, Real property, Navig waters, Lakes, Marshes, United States, S governments, Judicial decisions, Legal asp Land, Local governments, Governments.

Plaintiff state brought action against defendar possession to quiet title to marshland. The lan question had been surveyed and meandered navigable lake. However, no lake existed, and land was a marsh. Congress had conveyed marshland to the state, which had reconveyed the respective counties. Defendant claimed land by adverse possession against the cou Plaintiff contended that: (1) the United State establishing the meander, had ceded title to state in trust for the people, and (2) unlike against a county, a suit in adverse possession c not be maintained against the state. Observing the surveyor had no authority to fix a mea where no navigable lake existed, the Supr Court of Illinois held that title had passed unde conveyance of marsh lands to the state. Since fendant had established title by adverse possess title was held in defendant. (Hart-Florida)

A GEOLOGIC STUDY OF THE CHEMI QUALITY OF MEDICINE LAKE,
South Dakota Univ., Vermillon.
Merlin J. Tipton, and Richard G. Stockdale.
Available from NTIS as PB-197 529, $3.0 paper copy, $0.95 in microfiche. Completion port, South Dakota Water Resources Research stitute, January, 1971. 51 p, 2 tab, 7 fig, 16 r append. OWRR Project A-022-SDAK (1) an 022-SDAK (1).

Descriptors: Hydrologic aspects, Water qua *Evaporation, Chemical analysis, *Lakes, S ments, South Dakota, *Dissolved solids, Drai patterns (Geologic), *Drainage syst Geomorphology, Saline lakes.
Identifiers: *Medicine Lake (So Dak), *Cl drainage, Sediment cores.

Medicine Lake is a saline lake lying on the wes flank of the Coteau des Prairie in Codington C ty, SD. Total dissolved solids content ranges 35,000 parts per million to 65,000 parts per lion. The source of the salts entering Medi Lake is the result of 'normal' weathering of geo ic materials. The weathering products go into s tion with the groundwater, which is the prin source of recharge for Medicine Lake. Ver control data, supported by remote sensing the imagery, established Medicine Lake to be a cl drainage. Because evaporation exceeds preci tion large quantities of water are lost from closed drainage system. Groundwater moveme toward Medicine Lake from the southeast thro McKillicans Lake, Round Lake, and Horses Lake. Groundwater movement toward Medi Lake from the northwest is through a serie potholes. During the time groundwater is mo toward Medicine Lake it is exposed to evapora whenever it occupies one of the other lake ba As a consequence of this, concentration of the tial groundwater starts in McKillicans Lake progresses, with more evaporation and concen tion occurring, each time it is exposed in a basin. Medicine Lake, lying at the lowest eleva in the closed drainage system, receives gro water that has already been concentrated durin migration through the chain of lakes and poth Medicine Lake, because it is recharged by con trated groundwater, should, through more evap tion, contain the highest total dissolved solids tent which it does. The combination of a cl drainage system and a high rate of evapora seems to be the best explanation for the chem quality of the water in Medicien Lake.

BIOLOGICAL FIXATION AND TRANSFORMATION OF NITROGEN IN SMALL IMPOUNDMENTS,
Oklahoma State Univ., Stillwater. Dept. of Zoology.
Dale W. Toetz.
Available from NTIS as PB-197 586, $3.00 in paper copy, $0.95 in microfiche. Oklahoma Water Resources Research Institute, Completion Report, July 1970. 34 p, 3 tab, 4 fig, 21 ref. OWRR Project No A-012-OKLA (1).

Descriptors: *Nitrogen fixation, Ammonia, Impoundments, *Ammonification, Nitrates, *Nitrification, Diel, Oklahoma, *Analytical techniques, Lakes, Ponds, Cyanophyta.
Identifiers: Acetylene reduction method, 15N technique, *Ceratophyllum, Nitrate assimilation, Ammonia nitrate, Ammonia assimilation, Diel assimilation.

Biological fixation and transformation of nitrogen was studied in impoundments in central Oklahoma using the acetylene reduction method and 15 N techniques. Nitrogenase activity, probably microbial, was detected in a small lake during the winter. This source was calculated to be only 1% of the quantity of N falling directly on the surface in precipitation. Nitrogen fixation was not detected in a highly eutrophic pond, nor was it detected in a large mainstream reservoir. In both heterocystis blue-green algae and nutrient depletion were never observed. Biological N fixation does not appear to be important in these waters. Transformation of nitrogen was studied in the small lake where nitrogen fixation was detected. A Ceratophyllum-periphyton community is large in biomass and dominates the flora. This community was found to be capable of continuous NH4 assimilation, but could assimilate NO3 most rapidly only in the light. An effort was made to learn if NH4 and NO3 assimilation by this community could be predicted from a knowledge of concentration. Uptake was linear with concentration but the effect of N starvation of the slope of the curve has not been explored.

LAKE HOURLY DISPERSION ESTIMATES FROM A RECORDING CURRENT METER,
Ontario Water Resources Commission, Toronto.
Merv D. Palmer, and J. Bryan Izatt.
Journal of Geophysical Research, Vol 76, No 3, p 688-693, January 20, 1971. 6 p, 3 fig, 4 tab, 18 ref. ONR Contract N00014-67-A-0103-0007, NR 307-252.

Descriptors: *Dispersion, *Water circulation, *Great Lakes, *Lake Erie, Currents (Water), Lakes, Mixing, Current meters, Path of pollutants, Tracking techniques, Correlation analysis, Probability, Markov processes, Stochastic processes, Reynolds number, Data collections, Statistical methods, Computer programs.
Identifiers: *Dispersion (Lakes).

For the Great Lakes, mean hourly dispersion coefficients are predicted by using a first-order Markov chain model developed from continuous hourly current meter records at a fixed point. Dispersion coefficients compare favorably with other studies. The Eulerian data are assumed equivalent to Lagrangian because the Reynolds numbers were large, and because the velocity field was homogeneous over the distances considered. A conventional dye injection study at Port Maitland on Lake Erie verified the conversion of data from Eulerian to Lagrangian form. Concentrations were computed as a function of distance for a constant continuous point source of a passive contaminant. A method was developed for determining the maximum, mean, and minimum probable distances traveled by a particle in a period of hours. (Knapp-USGS)

TRITIUM STUDY OF THE MIXING OF WATERS IN LAKES AND ESTUARIES, WITH PARTICULAR REFERENCE TO THE LAKE OF GENEVA AND THE GIRONDE (FRENCH),
Paris Univ., Thonon-les-Bains (France). Center for Geodynamic Research.
M. Meybeck, P. Hubert, J. M. Martin, and Ph. Olive.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/32, p 523-541, 1970. 19 p, 9 fig, 4 tab, 13 ref.

Descriptors: *Tracers, *Tritium, *Mixing, *Lales, *Estuaries, Density stratification, Turbidity currents, Density currents, Water circulation, Water balance, Water sources, Diffusion, Dispersion, Stratified flow, Currents (Water).
Identifiers: *Lake Geneva, *Gironde.

Tritium was used as a tracer in a general study of the dynamics of the Lake of Geneva (Leman) and the Gironde in order to differentiate waters with identical physico-chemical characteristics. On the Lake of Geneva, tracers revealed a surface current, a main current at half depth and a turbidity current in a sublacustrine canyon. Three layers with their own well defined dynamic behavior (0-50 m, 50-150 m and 150-310 m) correspond to these movements. Only the surface layer may become homogeneous in winter. In the Gironde the use of tritium showed, in waters having identical or constant salinities, whether the fresh waters were of different fluvial origins. In this way a substantial difference in dynamic behavior and the absence of any significant exchanges between the edges and the center of the Gironde were found. In estuaries this method should permit the study of flood propagation and the formation of high-turbidity zones. (Knapp-USGS)
W71-04594

VERTICAL DENSITY CURRENTS--II,
Geological Survey, Washington, D.C.
W. H. Bradley.
Limnology and Oceanography, Vol 14, No 1, p 1-3, January 1969. 3 p, 2 fig, 3 ref.

Descriptors: *Density currents, *Laminar flow, *Dispersion, *Analytical techniques, Water properties, Air circulation, Density, Particle size, Technology, Application methods, Methodology, Hydrodynamics.
Identifiers: *Vertical flow, Virology, Mycology.

Examples of vertical density currents within the laminar flow domain, one in a water solution and the other in air, are presented. The examples illustrate new ways of introducing and dispersing microscopic particles into static fluids and demonstrate that a stable, clearly defined layer of dispersed particles forms first and that the vertical density currents originate and flow from the lower part of this layer. The new information comes from wholly unrelated lines of research, one in virology, and the other in mycology, but the information provides good experimental support in hydrodynamics. A mathematical approach can be used to develop the theory of vertical density currents so that the described observations can be applied to a broader spectrum of flow phenomena in air, water, and molten rock in the earth. (Lang-USGS)

MEASUREMENT AND ANALYSIS OF THE ANNUAL HEAT BUDGET FOR THE SEDIMENTS IN TWO WISCONSIN LAKES,
Dartmouth Coll., Hanover, N. H. Dept. of Biological Sciences, and Dartmouth Coll., Hanover, N. H. Dept. of Earth Sciences.
Gene E. Likens, and Noye M. Johnson.
Limnology and Oceanography, Vol 14, No 1, p 115-135, January 1969. 21 p, 13 fig, 5 tab, 25 ref. NSF Grant No GE-366.

Descriptors: *Heat budget, *Heat flow, *Lakes, *Bottom sediments, Bogs, Wisconsin, Thermocline, Marshes, Water temperature, Measurement, Instrumentation, Methodology.
Identifiers: *Stewart's Dark Lake (Wis.), Tub Lake (Wis.), Sediment temperatures.

Temperature was measured in the water, bottom sediments, and bog surrounding Stewart's Dark Lake and Tub Lake, Wisconsin, using a thermal probe to penetrate 8 m into the bottom material. In the deepest water of Stewart's Dark Lake, a steady state thermal gradient (0.20 deg C/m) was observed in the bottom sediments. Thermal conductivity of these gelatinous sediments was measured, and a steady-state heat flow value was derived. Isotherm patterns within these sediments and the bog demonstrate the importance of solar radiation and the effects of absorption and circulation in these lakes. Seasonal isotherm pattern changes are similar for both lakes. Temperature fluctuations are largely damped at depths below 4 m in the bogs. With respect to mean sediment temperature, each lake is surrounded by a relatively warm rim. The annual heat budget of sediments at the shoreline in Tub Lake is 3,670 cal/sq cm; at a water depth of 8 m, it is 70 cal/sq cm. The mean annual budget for the entire sediments of Stewart's Dark Lake is 730 cal/sq cm, and for Tub Lake is 970. These values are about 10 and 12%, respectively, of the total annual heat budgets for the water in each lake. (Lang-USGS)

CHEMICAL COMPOSITION AND PHYTOPLANKTON OF LAKES IN SOUTHERN ONTARIO,
Toronto Univ. (Ontario). Dept. of Botany.
J. H. Sparling, and C. Nalewajko.
Journal Fisheries Research Board of Canada, Vol 27, No 8, p 1405-1428, 1970. 10 fig, 4 tab, 34 ref.

Descriptors: *Water chemistry, *Phytoplankton, *Lakes, Geology, Ecotypes, Scenedesmus, Cultivated lands, Magnesium, Nutrients, Algae, Diatoms, Conductivity, Hydrogen ion concentration, Sodium, Potassium, Calcium, Chlorides, Bicarbonate, Electrolytes, Limestones, Cyanophyta, Chlorophyta, Chrysophyta.
Identifiers: *Southern Ontario (Canada), Specie associations.

Water chemistry in southern Ontario lakes is determined primarily by surface and bedrock geology and impact of cultivation. Total dissolved solids give a poor indication of electrolyte content of lakes, because of the varied geology. Four lake types are recognized: base-poor lakes (Precambrian shield), moderately base-rich lakes (Bancroft-Rideau lakes region) related to more easily weathered rocks, base-rich lakes (Limestone region south of shield receiving drainage from cultivated land), and base-rich lakes with high levels of magnesium (draining from Silurian dolomitic limestone bedrock and dolomite-rich glacial tills). Phytoplankton populations were partially related to the chemical composition of lake waters. Tabellaria flocculosa and to a lesser extent Asterionella formosa and Dinobryon divergens were associated mainly with base-poor lakes. A larger number of species, including Synedra acus, Pediastrum duplex, Scenedesmus quadricausa, Cyclotella meneghiniana, Synedra ulna, and Cyclotella kutzingiana, were significantly associated with base-rich conditions. An association diagram for all species found showed groupings, mostly of species that prefer base-rich conditions. Few species confined to base-poor lakes were found to form associations. Apparent associations between oligotrophic species and species known to prefer eutrophic lakes are explained by the fact that nutrients were depleted during survey. (Jones-Wisconsin)

PHYSICAL FACTORS WITH BEARING ON EUTROPHICATION IN LAKES IN GENERAL AND IN LARGE LAKES IN PARTICULAR,
Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
C. H. Mortimer.
Eutrophication: Causes, consequences, correctives. Printing and Publishing Office, National Academy of Sciences, Washington, D. C., p 340-368, 1969. 8 fig, 20 ref.

Descriptors: *Eutrophication, *Lakes, *Diffusion, Lake Michigan, Great Lakes, Hydrologic aspects, Oxidation-reduction potential, Temperature, Nutrients, Fluid mechanics, Activation energy, Stratification, Photosynthesis, Erosion, Iron, Coriolis force, Sediments, Manganese, Stratified flow, Hypolimnion, Epilimnion, Thermocline, Winds, Waves (Water), Currents (Water).
Identifiers: *Large lakes.

Dynamics of diffusion, of oxygen balance, and of nutrient gains and losses affect biological production in natural waters. Nutrient influx is influenced by rock weathering, soil formation, and in drainage basin soil processes. Whichever way the surface-sediment layer becomes reduced by diffusion the effects, especially on subthermocline water mass are profound and associated not only with reduction and mobilization of iron and manganese and the unlocking of adsorbed materials, but also with the resultant removal of a barrier to unimpeded diffusion across the sediment-water interface. Although supply variations from drainage basin are not without influence, iron and manganese core profiles reflect the control of redox conditions. If lake basin is long enough or wind distrubance great enough, part of the hypolimnion will be raised into contact with the atmosphere and oxygen will be distributed to subthermocline levels. Recent findings indicate that both the forced motions (wind-driven currents) and the free motions (internal waves) are characterized by dominance of shore-parallel, quasi-geostrophic flow near shore and by frequent occurrence of rotating (inertial or near-inertial) flow off shore; this combination may lead to partial or temporary separation of characteristic coastal and offshore water masses, resulting in entrapment of nutrients. LIMNOLOGICAL STUDIES ON LAKES IN THE DESCHUTES NATIONAL FOREST, OREGON. I. ODELL LAKE,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
Douglas W. Larson.
Oregon State University, Corvallis, Water Resources Research Institute WRRI-4, 1970. 34 p, 9 fig, 9 tab, 21 ref. OWRR Project A-003-ORE (3).

Descriptors: *Limnology, *Lakes, *Oregon, Phytoplankton, Productivity, Temperature, Nutrients, Seasonal, Zooplankton, Sampling, Dissolved solids, Soils, Pumice, Eutrophication, Oligotrophy, Geology, Climatic data, Bathymetry, Hydrogen ion concentration, Depth, Conductivity, Optical properties, Alkalinity, Calcium, Magnesium, Potassium, Sodium Daphnia, Chlorophyta, Chrysophyta, Photosynthesis, Bioassay, Phosphorus, Iron, Nitrates, Ammonia.
Identifiers: *Deschutes National Forest (Ore), *Odell Lake (Ore), Crater Lake (Ore), Lapillus.

The limnology of Odell Lake is documented prior to substantial deterioration by recreation. Recorded are phytoplankton standing stock and primary production measurements (considered unusually high for an oligotrophic lake) and providing physical, chemical, and biological d establish a reference point for periodic estim of the effects of population impact. Temper light and nutrients appear to favor produc High production was sustained during summe fall, with algal blooms not uncommon; large ties of zooplankton were observed. Concent of total dissolved solids in Odell Lake was 1/3 of Crater Lake, yet, production in Odell was 8-10 times greater. Crater Lake contai elements comprising 75% of total dissolved suggesting that, although the value of tota solved solids is relatively high, certain essentia could be deficient. There is probably a b balanced supply of ions in Odell Lake with being deficient. The most salient feature of th profile was the large porosity and highly perm nature of the underlying pumiceous layers, th which subsurface water percolation woul rapid. Lake usage has increased resultin frequent pulses of phytoplankton and rela high rate of primary production. (Jones-Wi sin)

I. PRINCIPAL FEATURES IN THE CHEM TRY OF LAKE MALAREN,
Thorsten Ahl.
In: Eutrophication in large lakes and impou ments, Uppsala Symposium, Sweden, May 19 Organisation for Economic Co-Operation Development, Paris, 1970. p 169-195. 22 fig.

Descriptors: *Lakes, *Water pollution sour *Chemistry, Water pollution effects, Sampl Water properties, Watershed (Basins), Precip tion, Acids, Air pollution, Geology, Nutrients.
Identifiers: *OECD, *Uppsala Symposium 19 Lake Malaren (Sweden), Sulphuric a Hydrochloric acid, Nitric acid.

Malaren is one of the largest and most irregul shaped lakes of Sweden and presents a comple water basins of widely different chemical and bi

ıts. The detailed investigation of this lake was in 1964 following alarming deterioration of quality. The chemical analyses revealed a elationship between the degree of eutrophi- of different parts of the lake and geology of sin and location of population centers. No an bi-monthly sampling at 40.. stations pro- information on water temperature, trans- y, specific conductance, pH, and supply of ıts. A record of nutrients discharged from ant sub-watersheds, domestic sewage, and ial waste provided an estimate of the lake's t load. Recently, attention is given to acidifi- of precipitation, and, in turn, lake water by ic, nitric, and hydrochloric acids supplied e atmosphere by industry and agricultural ers. s: *OECD, *Uppsala Symposium 1968, Neagh (Ireland), Algal blooms.

ort provides a large volume of analytical ecology, biology, hydrology, and pollution large, rather shallow, and definitely c lake of northern Ireland. Investigations rgest fresh water basin of the British Isles iated more than 50 years ago and assem- uch information on phytoplankton, ton, salmonoids, other fish, waterfowl, rmonid flies. The combined effects of ral, industrial, and airborn pollution from the watershed of about 4,500 sq km produced in 1967 extensive blooms that killed fish and precluded cattle from drinking water. Subsequent analyses revealed that the toxicity was due to blue-green alga Anabaena flos aquae, rather than a deficiency of oxygen. The cost/benefit ratio of ameliorations, possible toxicity of Anabaena to humans and animals, methods of treatment of sewage discharges, and control of algal blooms are the most pressing problems that confront the Government of Northern Ireland. REPORT ON LAKE MAGGIORE,
G. Bonomi, M. Gerletti, E. Indri, and L. Tonolli.
In: Eutrophication in large lakes and impoundments, Uppsala Symposium, Sweden, May 1968. Organisation for Economic Co-Operation and Development, Paris, 1970. p 299-341. 10 fig, 9 tab, 207 ref.

Descriptors: *Lakes, *Eutrophication, *Water pollution sources, Water pollution effects, Political constraints.
Identifiers: *OECD, *Lake Maggiore, *Uppsala Symposium 1968, Algal blooms, Tabellaria fenestra, Oscillataria rubescens.

The geographic location destined the Lago Maggiore to serve as the final receptacle of domestic sewage and industrial discharges from 6600 sq km watershed of Italy and Switzerland. In spite of this, the average depth of 180 meters has thus far kept the concentrations of organic matter, nitrogen, and phosphorus near the oligotrophic-mesotrophic boundary. The fact that a large part of the drainage basin does not permit cultivation is an important contributing feature. The distribution of planktons in this 65 km long, but rather narrow lake is strongly influenced by the pattern of settlement, nature of tributary waters, and thermal characteristics. The estimates of primary productivity for the entire lake vary from 140 to 175 g carbon sq m/yr. The oxygen content in the deep layers is still satisfactory, but the blooms of Tabellaria fenestra and the first bloom of Oscillataria rubescens in 1967 are the 'alarm bells' of eutrophication. Also, infection of fish by bacteria, fungi, viruses, and tapeworms indicates the hazard of sewage pollution. While the distribution of oxygen and planktonic, benthic, and fish biocoenose provides an adequate record of the health conditions of the lake, the management of the system encounters engineering, social, and political difficulties. The latter may be particularly pronounced when the body of water is in the possession of two different States. (See also W71-04630) (Wilde-Wisconsin)

I. WATER QUALITY MAINTENANCE OF LAKE CONSTANCE.
International Water Protection Commission for Lake Constance.

In: Eutrophication in large lakes and impoundments, Uppsala Symposium, Sweden, May 1968. Organisation for Economic Co-Operation and Development, Paris 1970. p 345-357. 5 fig.

Descriptors: *Lakes, *Eutrophication, *Water pollution sources, *Water pollution effects, International commissions, Water quality control, Sewage treatment.
Identifiers: *Lake Constance, *OECD, *Uppsala Symposium 1968, Germany, Austria, Switzerland.

The Obersee-Untersee twins of Lake Constance serve as storage basins for waters contributed by the uplands of Germany, Austria, and Switzerland. Unfortunately, aside from water, the lake receives sewage and wastewater of the shore communities of the three Republics. The state of eutrophication of different parts of the lake is instructively illustrated by a color map showing four degrees of pollution. The deterioration of water quality threatens the survival of the 'Felchen,' a salmonid of an exceptionally delicate taste, and other fish totaling 4,000 ton annual catch. Following prolonged negotiations, in 1960 the three bordering states signed an international agreement of anti-pollution measures, an act which alone can promise success of water protection. The experts of the International Commission for Lake Constance digested the results of previous investigations and greatly enlarged the scope of research. The results of analyses indicated that the sewage phosphorus is the main cause of the biological deterioration of the lake. In consequence, a diversified program of sewage purification is now in the state of progressive materialization. (See also W71-04630) (Wilde-Wisconsin)

LAKES AND IMPOUNDMENTS IN THE NETHERLANDS.

In: Eutrophication in large lakes and impoundments, Uppsala Symposium, Sweden, May 1968. Organisation for Economic Co-Operation and Development, Paris, 1970. p 555-560.

Descriptors: *Lakes, *Canals, *Eutrophication, Water management (Applied), Water pollution effects, Water pollution control, Fish, Reaeration, Potable water, Desalination, Water purification, Artificial recharge, Groundwater recharge, Water storage.
Identifiers: *OECD, *Uppsala Symposium 1968, Boezems, Holland.

The 'boezems' of interconnected canals and lakes form the unique artificially controlled water system of Holland. The water levels in these networks are maintained by sluices and powerful pumping stations. Continuous flushing is used to reduce pollution and salt content of brackish seepage. Flushing with fresh water of IJssellake and Rhine decreases the salinity of the boezems, but not the degree of water eutrophication; IJssellake receives an enormous input of phosphorus and the Rhine is loaded with nutrients. In turn, the growth and blooms of Asterionella formosa, Anabaena spiroidia, and other algae hinder fish life and recreational activities, and require intensive purification of water for either drinking or industrial purposes. Improvement in the supply and quality of water is sought in artificial recharge of groundwater and storage of surface water in large reservoirs. Some isolated sand and gravel borrow-pits preserve water of excellent quality. Recent trials demonstrated that air-bubble injections raise deep saline water and alleviate anaerobic conditions of hypolimnia. (See also W71-04630) (Wilde-Wisconsin)

THE INTERNATIONAL FIELD YEAR FOR THE GREAT LAKES; A PROGRAM OF SYNOPTIC STUDIES OF A LARGE LAKE,
L. A. Heindl, and I. C. Brown.
In: Eutrophication in large lakes and impoundments, Uppsala Symposium, Sweden, May 1968. Organisation for Economic Co-Operation and Development, Paris, 1970. p 383-389. 1 tab.

Descriptors: *Lakes, *International Hydrological Decade, *Lake Ontario, Synoptic analyses, Hydrologic aspects, Meteorological data, Water balance, Heat balance, Water circulation, International commission, Foreign countries, Standards, Data collections.
Identifiers: *OECD, *Uppsala Symposium 1968, IFYGL.

In the early 60's hydrologists all over the world came to realize the crucial need for information on the quality of natural waters and management of water resources. Nearly 100 nations banded together in a 10-year program of hydrological research, designated as the International Hydrological Decade. The IHD found strong support in the USA and Canada, and the first joint effort of the two countries found its expression in the International Field Year for the Great Lakes (IFYGL).

The proposed field year activity is to be confined to the Lake Ontario, its meteorology, terrestrial water balance, heat balance, and water movement. Analyses and preparation of reports would be extended through 1973. The Steering Committee will provide direction to the program, and operational coordination will be effected by specialists employed by the Inland Water Branch of Canada and U S Corps of Engineers. The operational procedure in each country, however, will be in accord with their practices. (See also W71-04630) (Wilde-Wisconsin)

THE EUTROPHICATION OF LAKE MICHIGAN,
John C. Ayers.
In: Eutrophication in large lakes and impoundments, Uppsala Symposium, Sweden, May 1968. Organisation for Economic Co-Operation and Development, Paris, 1970. p 399-408. 7 tab, 15 ref.

Descriptors: *Lakes, *Lake Michigan, *Eutrophication, Water pollution effects, Dissolved solids, Nitrogen, Phosphorus, Fish, Algae, Lampreys, Calcium carbonate, Winds, Mixing, Thermal stratification, Thermocline, Isotherms.
Identifiers: *OECD, *Uppsala Symposium 1968, Algal blooms, Cladophora, Alewife, Milky water, Thermal bar.

The eutrophication of Lake Michigan is probably most strongly pronounced in the vicinity of Chicago. In this region, the content of total dissolved solids has risen during the past 75 years from 130 to 170 ppm. Nitrogen and phosphorus concentrations have now reached the nuisance-algae-bloom level. Since 1926 the phytoplankton increased annually at a rate of 13 organisms per millimeter. Recently Cladophora polluted 6 public beaches. The records of fish and zooplankton were distorted by immigrant species, such as sea lamprey and alewife. The main body of Lake Michigan is not easily assessed, but studies of the last 40 years revealed significant changes in zooplankton, formation of marl in epilimnion, increased turbidity, and a reduction in hypolimnic oxygen. In recent years, formation of calcium carbonate crystals produced milky water color which very likely reduces the depth of the euphotic zone and diminishes the content of near-bottom oxygen. The distribution of the inshore pollutants through the main body of the lake is accomplished largely by winter wind mixing and migration of the 'thermal bar,' the spring equalization of water masses having temperature above and below 4 degree C. The waters injected into the main body epilimnion by rotation of 4 degree isotherm support high phytoplankton and produce blooms after the thermal stratification is completed. RECENT DEVELOPMENTS AND PRESENT-DAY SITUATION IN RELATION TO THE LAKE OF LUGANO AND ITS TRIBUTARIES,
Otto Jaag, and Erwin Marki.
In: Eutrophication in large lakes and impoundments, Uppsala Symposium, Sweden, May 1968. Organisation for Economic Co-Operation and Development, Paris, 1970. p 533-551. 13 fig, 4 tab.

Descriptors: *Lakes, *Eutrophication, Water pollution effects, Water pollution sources, Water pollution control, Fishkill, Fish harvests, Sewage, Industrial wastes, Sewage treatment.
Identifiers: *OECD, *Uppsala Symposium 1968, Oscillatoria rubescens.

The two-thirds Swiss and one-third Italian Lake Lugano exhibited symptoms of malady as early as 1889, the year of the first dramatic fish kill. Investigations during the past 20 years were largely conducted in response to the progressively declining fish harvests. Research revealed one of the reasons for the biological deterioration of the lake is a continuous reduction in the hypolimnic oxygen concentration. The average oxygen content at the end of summer stagnation at a depth of 50 m had decreased from 7.4 mg/l in 1946 to 4.1 mg/l in 1964. The unfavorable alteration in the chemical composition of the lake is attributed to the inflow of domestic sewage and industrial waste water that induced lush development of Oscillatoria rubescens. Some improvement in water quality is expected following the construction of a purification sewage plant for the City of Lugano. (Wilde-Wisconsin)

LIMNOLOGY OF TWO RE-REGULATION RESERVOIRS IN SZECHOSLOVAKIA,
Ceskoslovenska Akademie Ved, Prague. Hydrobiologicka Lab.
Milan Straskraba, and Pavel Javornicky.
Typescript. 69 p, 34 fig.

Descriptors: *Limnology, Reservoirs, Hydrologic aspects, Biological properties, Epilimnion, Temperature, Energy, Surface waters, Water temperature, Mathematical models, Phytoplankton, Zooplankton, Photosynthesis, Chlorophyll, Primary productivity, Oxygen.

An empirical model of annual temperature cycles is developed for Vltava Cascade Reservoirs. During a two year study and evaluation of 10 years of data the temperature change within the poorly stratified water body of the re-regulation reservoir, fed from the hypolimnion of the power - generation reservoir, was found to correlate well with the air - water temperature gradient and retention time. A second order sine curve proved to express adequately the annual temperature cycles within the Cascade reservoirs. The species composition, abundance and standing crop of phyto-and zooplankton, as well as the chlorophyll-a content and photosynthetic activity of phytoplankton, are explained for the conditions of the reservoirs. The upper reservoir resembles arctic lakes as to phytoplankton activity. (Novotny-Vanderbilt)

SURF-BEAT ORIGIN FOR PULSATING BO TOM CURRENTS IN THE RIO BALSAS SU MARINE CANYON, MEXICO,
Geological Survey, Menlo Park, Calif.
Erk Reimnitz.
Geological Society of America Bulletin, Vol 82, 1, p 81-89, January 1971. 9 p, 5 fig, 10 ref.

Descriptors: *Surf, *Erosion, *Rip curre *Ocean waves, *Canyons, Estuaries, Rivers, S ment transport, Bed load, Channels, Streamfl Currents (Water).
Identifiers: *Surf-beat current pulses, *Subma canyons, *Mexico.

At the head of a tributary to the Rio Balsas s marine canyon system in Mexico, during a per of large surf, river discharge deflected a pulsat longshore current (peaking at over 7 km/ seaward over the tributary heading in the surf zo This pulsating flow occasionally entered the ri mouth, causing rhythmic fluctuations with a plitudes of at least 30 cm and a period of abou minutes within the mouth, as recorded by a p tially filtered tide gage. Current pulses with e mated velocities of 4 km/hr transport la amounts of suspended sand down an axial slope 26 deg. This bottom flow was at least 3 m thick, was characterized by pulses separated by q periods in phase with the surface rip current. E mated water budget suggested that the entire wa column below the rip current at 18 m was not fl ing seaward during the pulses. The magnitude the flow was sufficient to erode the canyon wa These observations substantiate that rip curre play a role in the formation of some submar canyons. (Knapp-USGS)

nges in stream morphology can be deteristic (alterations of variables within the physical em by climatic or cultural influences and efs) or probabilistic (random processes). It may difficult or impossible to isolate and identify cific cause and effect relationships. Evaluation hanges in channel pattern and sinuosity of the sas River involves the selection of data of apriate quantity and quality. Data for channel ern and stream discharge, which constitute an irically-derived functional relationship, best t the requirements. Stream discharge, through ssociation with precipitation, is investigated on ne scale of several decades. Annual discharge re these measurements were recorded is estimated indirectly from annual precipitation computed as a representative figure for the entire drainage basin. Settlement and cultivation accelerated erosion and resulted in increased sediment loads supplied to the river. The significance of this change is discussed along with other possible factors. The channel lengths and gradients upstream and downstream from the study area are studied. An interpretation of the configuration and behavior of the river prior to 1950 is presented.

American Journal of Science, Vol 270, No 2, p 109-135, February 1971. 27 p, 7 fig, 8 tab, 33 ref.

Descriptors: *Erosion, *Weathering, *Leaching, *California, Stream erosion, Sheet erosion, Geomorphology, Hydrogeology, Geochemistry, Water chemistry, Vegetation effects.
Identifiers: *Erosion rates, *White Mountains (Calif).

Long-term total erosion rates in the White Mountains, estimated from depths of removal beneath a 10.8-m.y.-old basalt, range from 1 to 3 cm per 1000 years. Present rates of chemical denudation, corrected for contributions from the atmosphere and biosphere, are 0.14 to 0.19 cm per 1000 years in dominantly adamellite terrain and 1.7 to 2.1 cm per 1000 years in areas underlain by Reed Dolomite. These figures are much lower than Reed Dolomite denudation rates estimated from botanical evidence in the same area (LaMarche, 1968) but are consistent with erosion rates in the nearby Sierra Nevada. Chemical denudation by plant uptake and litter erosion was evaluated and compared with removal in solution. Although total amounts of biogeochemical erosion do not appear to be significant, this process may account for some part of the extraction of P and K and is apparently responsible for appreciable portions of Al, Fe, and Mn denudation. In stream waters draining dolomite, partial pressures of CO2 exceed values for air and adamellite-derived waters by over an order of magnitude. These differences are ascribed to biological factors rather than to solution of carbonate minerals. (Knapp-USGS)

MASS PHYSICAL PROPERTIES AND SLOPE STABILITY OF SEDIMENTS OF THE NORTHERN MIDDLE AMERICA TRENCH,
Woods Hole Oceanographic Institution, Mass.
David A. Ross.
Journal of Geophysical Research, Vol 76, No 3, p 704-712, January 20, 1971. 9 p, 7 fig, 31 ref. ONR Contract N00014-66-C-0241.

Descriptors: *Bottom sediments, *Physical properties, *Slope stability, *Continental shelf, Pacific Ocean, Clay minerals, Particle size, Moisture content, Sampling, Clays, Silts, Porosity, Shear strength, Density, Cores.
Identifiers: Middle America Trench.

The mass physical properties (shear strength, porosity, and density) of 32 cores from the northern part of the Middle America Trench have been determined. A stability analysis using the shear strength data (determinations made with a vane shear device) indicate that the sediments are generally stable except on the landward flank of the trench where slumping is possible under the slope conditions observed. Comparisons of gravity-piston core pairs indicate differences in porosity and shear strength that are the result of the coring procedure. The corer used in this study was designed to minimize sample disturbance, but better coring devices are needed before in situ conditions are approached. Porosity and the log of shear strength are inversely related, and porosity has a positive relationship to clay content. The specific gravity of the sediments is 2.66 gm/cc (at zero proosity), a value similar to that of other areas with a high rate of terrigenous deposition. (Knapp-USGS)
W71-04566

THE MECHANICS OF SAND TRANSPORT ON BEACHES,
Scripps Institution of Oceanography, La Jolla, Calif.
Paul d. Komar.
Journal of Geophysical Research, Vol 76, No 3, p 713-721, January 20, 1971. 9 p, 3 fig, 14 ref.

Descriptors: *Sediment transport, *Beaches, *Littoral drift, *Ocean waves, Ocean currents, Shores, Waves (Water), Sands.
Identifiers: Beach sediment transport.

On steep-faced beaches where waves break and swash at an angle to the shoreline, the littoral drift of beach material results from the saw-tooth motions of the sediment in the longshore direction. The sand moves forward obliquely to the shore under the incoming wave swash and then moves normal to the shoreline under the return flow. For such transport conditions a rational derivation leads to a relationship using a function of the angle the breaking wave makes with the shoreline. This often applied relationship, previously only intuitive, is rigorously established for special saw-tooth transport and applies also when the sediment is transported by a longshore current proportional to the orbital velocity under the breaking waves. These are the two most important mechanisms by which sediment is transported along the shore under wave action. The profiles of variation of the longshore sand transport as a function of the distance seward of the swash line are examined theoretically. The results conform with the field observations. (Knapp-USGS)

STOCHASTIC MODEL FOR SAND DISPERSION,
Illinois Univ., Urbana. Water Resources Center; Illinois State Water Survey, Urbana; and Iowa Univ., Iowa City. Dept. of Mechanics and Hydraulics.
Chih Ted Yang, and William W. Sayre.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY2, Paper 7892, p 265-288, February 1971. 24 p, 16 fig, 2 tab, 10 ref, append.

Descriptors: *Sediment transport, *Mathematical models, *Stochastic processes, *Dispersion, Open channel flow, Model studies, Hydraulic models, Statistical methods, Probability, Channel morphology, Sedimentary structures, Bed load.
Identifiers: Sand dispersion.

The movement of sand particles is expressed in terms of steps and rest periods. The longitudinal dispersion of sand particles along the bed of an alluvial channel is formulated in a general one-dimensional stochastic model. Three different methods are suggested for determining the three parameters in the stochastic model. Experimental

results indicate that the step lengths follow a gamma distribution and that the rest periods follow an exponential distribution. Statistical analysis of bed configuration indicates the movement of sand particles along an alluvial bed should be closely related to the statistical properties of the bed configuration. The results of longitudinal dispersion experiments compare favorably with predications based on the stochastic model. (Knapp-USGS)

PORTABLE RADIOISOTOPE GAUGES FOR SUSPENDED SEDIMENTS,
International Atomic Energy Agency, Vienna (Austria).
T. Florkowski.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/34, p 545-554, 1970. 10 p, 6 fig, 2 tab, 5 ref.

Descriptors: *Sediment load, *Suspended load, *Nuclear meters, *Gamma rays, Instrumentation, Calibrations, Radioactivity techniques, Soil density probes, Sedimentation, Sediment transport.
Identifiers: *Nuclear sediment meters, *Gamma backscatter probes.

A new type of gage for measurement of suspended sediments is described. A gage with a Am-241 radioisotope source used attenuation of scattered gamma photons as a measure of sediment concentration. A theoretical and semi-empirical approach to the design of the instrument is discussed, including the influence of chemical composition of the sediment. A practical method for correcting a laboratory made calibration curve for the changes of chemical composition of the sediment is proposed for the new probe and for the absorption-type Cd-109 probe. Field tests of the probes in different conditions are evaluated. (Knapp-USGS)

TURBIDIMETRY: MEASUREMENT OF X- OR GAMMA-ABSORPTION OR MEASUREMENT OF NATURAL RADIOACTIVITY (FRENCH),
Commissariat a l'Energie Atomique, Saclay (France). Centre d'Etudes Nucleaires.
G. Courtois, F. Anguenot, and C. Magloire.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/35, p 555-580, 1970. 26 p, 11 fig, 2 tab, 8 ref.

Descriptors: *Sediment load, *Suspended load, *Nuclear meters, *Gamma rays, Instrumentation, Calibrations, Radioactivity techniques, Soil density probes, Sedimentation, Sediment transport, Clays, Silts.
Identifiers: *Nuclear sediment meters, *Gamma-ray probes.

Turbidity may be measured by radioactive means on the basis of the two following methods: (a) measurement of gamma absorption in a nuclear gage, corresponding to a measurement of the density of the medium; (b) in-situ measurement of the natural radioactivity of the sediment in suspension. The two methods were evaluated simultaneously by using a gamma absorption gage (Am-241) and by carrying out in-situ measurements of natural radioactivity of sediment in suspension. The advantages and disadvantages of each of these two methods are critically analyzed. It would appear, in particular that the natural radioactivity gage is much less sensitive to local salinity and is a valuable tool in estuaries of variable salinity and of generally high turbidity, and that being stronger and simpler, it is less sensitive to different parameters (electronic drifts, geometric variations, etc). On the other hand, it must be calibrated for each site and periodically on the same site. Further, it can only be used in a clayey medium. Particulars are given for the use of each of these instruments. (Knapp-USGS)

THE MASS OF LABELLED INJECTION SEDIMENTS FOR USE IN A RADIOACTIVE TRACER EXPERIMENT IN DYNAMIC SEDIMENTOLOGY (FRENCH),
Commissariat a l'Energie Atomique, Saclay (France). Centre d'Etudes Nucleaires.
G. Courtois, and G. Sauzay.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/36, p 581-616, 1970. 36 p, 19 fig, 4 ref.

Descriptors: *Sediment transport, *Bed load, *Tracking techniques, *Tracers, *Tagging, Instrumentation, Nuclear meters, Radioactivity techniques, Sands.
Identifiers: *Bed load tracers.

A general theory is given of detector response variation and of the probability associated with each value of that response when the number and distribution of the radioactive sources in a given volume vary while the activity remains constant. The theory is applied to the problem of detecting a cloud of tracers in sedimentology experiments. First, the calculation is made with a tracer distributed at the surface of the bed for a sand of uniform grain size and for a given detector of known geometric response. Static detection of the cloud and then a dynamic detection (probe pulled along the bed) were studied. In both cases the minimum mass of tracer per unit of activity which has to be immersed in order to obtain a fluctuation in the count-rate due to the change in position of the radioactive grains, equivalent to 30% of the mean count-rate were determined. General formulae take these parameters into account and can be used for determining the quantities of sand for immersion as a function of the measurement parameters and of the characteristics of the sediment. Dynamic detection requires a quantity of tracer per unit ten times smaller than for static detection, the latter in turn requiring ten times less tracer than a core-sampling analysis. (Knapp-USGS)

AN EVALUATION OF PROCEDURES USED IN COMPUTING CHEMICAL DENUDATION RATES,
Geological Survey, Menlo Park, Calif.
Richard J. Janda.
Geological Society of America Bulletin, Vol 82, No 1, p 67-79, January 1971.13 p, 1 fig, 2 tab, 47 ref.

Descriptors: *Weathering, *Erosion, *Solutes, *Dissolved solids, Leaching, Water pollution effects, Erosion, Bicarbonates, Sulfates, Chlorides, Nitrates, Silica.
Identifiers: *Chemical denudation, *Erosion (Chemical).

Computations of chemical denudation rates should be based only upon those components of dissolved loads of streams that are derived from chemical weathering of rocks and soils, even though identification of those components is difficult and imprecise. Past computations of chemical denudation rates exaggerated by 1.4 to 2.4 times the significance of this process because they were calculated from total dissolved loads. In crystalline s
icate rock terrane, commonly 25 to 55% of the di
solved solids are HCO3, SO4, Cl and NO3, th
cannot be derived from the underlying rock; i
stead these ions are derived either directly from t
atmosphere or from atmosphere-biosphere intera
tions. Atmospheric contributions to dissolved loa
of dilute natural waters are substantial. Concentr
tion of natural solutes represents a modification
natural denudation processes that does not chan
the rate of denudation. Addition of new solut
represents man-induced, accelerated chemic
denudation. (Knapp-USGS)

FRESH WATER IRON-MANGANESE NODULE IN LAKE GEORGE, NEW YORK,
Rensselaer Polytechnic Inst., Troy, N. Y. Dept.
Geology.
Manfred Schoettle, and Gerald M. Friedman.
Geological Society of America Bulletin, Vol 82, N 1, p 101-109, January 1971. 9 p, 10 fig, 2 tab, 3 ref.

Descriptors: *Sedimentation, *Manganese *Lakes, *New York, *Chemical precipitatio Water chemistry, Mineralogy, Iron, Bottom sed ments, X-ray analysis, Geochemistry.
Identifiers: *Manganese nodules, *Lake Georg (NY).

Lake George, New York, is the site of a ne discovery of iron-manganese nodules. Thes nodules occur at a water depth between 21 and 3 m along a stretch of lake extending for about 5 n north and south of the Narrows, a constricte island-dotted area which separates the north an south Lake George basins. Nodules occur on within the uppermost 5 cm of a varved glacial cla The Lake George nodules are enriched in iron wit respect to marine nodules but are lower in mar ganese. They have a higher trace element concen tration than nodules from other known freshwate lake occurrences, but a lower concentration tha marine nodules. (Knapp-USGS)

CHEMICAL QUALITY OF MICHIGAN STREAMS,
Geological Survey, Washington, D.C.
Warren W. Wood.
Geological Survey Circular 634, 1970. 21 p, 12 fig, 1 tab, 20 ref.

Descriptors: *Water quality, *Surface waters, *Michigan, *Hydrologic data, *Data collections, Streams, Chemical analysis, On-site tests, Laboratory tests, Water resources development, Streamflow, Discharge measurement, Water temperature, Geology, Geochemistry, Water chemistry, Water pollution sources.
Identifiers: *Michigan streams (Chemical quality).

o aid in defining the chemical quality of stream aters in Michigan, samples were collected at ap-roximately 200 gaging stations. One series of sam-es was collected in late March and early April 967 when streamflow was high. The second set as collected in late August and early September 967 under conditions of low streamflow. All mea-red parameters illustrate distinct regional pat-ms of distribution that shift only slightly under nditions of high and low flow. Water in the reams is of the calcium magnesium bicarbonate pe and remains this type under high- and low-w conditions. Concentrations of dissolved sub-ances are generally lower during periods of high w than during periods of low flow. The higher ncentrations that occasionally occur at spring gh flows are attributed to inflow of water from mbination of effluent from sewers, fertilizers, d possibly road salt. Considering all parameters, ere is a distinct tendency for the most dilute ater to appear in the northern peninsula. Woodard-USGA)

CHEMICAL PROCESSES AT THE AIR-SEA INTERFACE: THE BEHAVIOR OF FLUORINE,
Naval Research Lab., Washington, D.C.
P. E. Wilkniss, and D. J. Bressan.
Journal of Geophysical Research, Vol 76, No 3, p 736-741, January 20, 1971. 6 p, 3 tab, 14 ref.

Descriptors: *Water chemistry, *Sea water, *Air-water interfaces, *Ion exchange, Sprays, Evaporation, Aerosols, Bubbles, Surf, Waves (Water), Winds, Chlorides, Fluorides.
Identifiers: *Ion fractionation.

Ion fractionation between fluorine and chlorine at the air-sea interface was investigated. Radiochemical experiments showed a decrease in the F/Cl ratio for laboratory aerosols produced from sea water. Marine aerosols showed an increase in the F/Cl ratio with a possible contribution from airborne dust contamination. Jet drops in the laboratory and naturally occurring marine jet drops showed little to no change. Radiochemical tracers also showed that drying of sea water droplets would sometimes increase the F/Cl ratio of the salt residue, whereas acidification of the sea water always caused the residue to have a decreased ratio. Journal of Geophysical Research, Vol 76, No 3, p 745-752, January 20, 1971. 8 p, 5 fig, 17 ref. ONR Contracts NR 307-252, Nonr 477 (24) and N0014-67-A-0317-0001.

Descriptors: *Water chemistry, *Sea water, *Carbon dioxide, *Saturation, *Mixing, Currents (Water), Ocean currents, Ocean circulation, Air-water interfaces.
Identifiers: Oceanic upwelling.

Measurements of the equilibrium concentration of carbon dioxide with respect to air in the surface waters of the North Pacific Ocean and Bering Sea made on a summer 1968 cruise aboard the R. V. Oceanographer were compared with earlier data collected in the southeastern Pacific Ocean off Peru and Chile. Experimental procedure used infrared analysis of equilibrated air and sea water for CO2. Supersaturation of carbonate in the sea with respect to air was noted within northeastern Pacific coastal regions associated with dilution by river inflow and upwelling. Similarly, data obtained off the South American coast showed high surface-water concentrations of CO2 in areas of upwelling. Undersaturation was observed in the northeast Pacific Ocean near Unimak Pass and east of ST. Matthew's Island in the Bering Sea. Near-equilibrium conditions were observed between 48 deg and 49 deg N latitude and from 161 deg to 150 deg 30 min W longitude. (Knapp-USGS)

VERTICAL ZONING IN CHEMICAL COMPOSITION OF GROUNDWATER IN MASSIFS OF EASTERN MONGOLIA AND SOUTHEASTERN TRANSBAIKAL,
Akademiya Nauk SSSR, Moscow. Research Lab. of Foreign Geology.
B. N. Marinov, and N. A. Marinov.
Translated from Doklady Akademii Nauk SSSR, 1969, Vol 188, No 2, p 434-437, September-October. Academy Sciences USSR Doklady, Earth Science Sections, Vol 188, No 1-6, p 187-190, April 1970. 4 p, 2 tab, 6 ref.

Descriptors: *Water chemistry, *Groundwater, *Hydrogeology, Aqueous solutions, Salinity, Bicarbonates, Calcium, Magnesium, Sulfates, Groundwater movement, Water balance, Water circulation, Leaching, Aquifers, Mineralogy.
Identifiers: *USSR.

Mountainous massifs are widespread in eastern Mongolia and in the adjacent part of southeastern Transbaikal and often constitute long, low ranges. Structurally, they are generally horsts. They consist of metasedimentary, carbonate and extrusive formations of the Precambrian and Paleozoic; terrigenous and sedimentary volcanic formations of the Triassic and Jurassic; and intrusive complexes, ranging in age from Precambrian to middle Mesozoic, inclusively. The groundwater accumulated in these rocks as a result of the irregular distribution of fractures is free in some places but under pressure in others. It is recharged by atmospheric precipitation and condensed moisture. In the distribution and chemical composition of such water there is vertical zoning. The highest parts of massifs hold extremely fresh, calcium or magnesium bicarbonate water with a salinity of 1 g/liter and with a relatively high concentration of silicon dioxide and organic matter. Downslope, owing to the lengthening of seepage routes and to the longer contact of the water with the host rock, the salinity increases gradually, culminating (at 0.4 to 0.8 g/liter) at the foot of mountain slopes. The water varies in composition as well as in salinity; it changes into sulfate-bicarbonate water or water of mixed anionic and cationic composition. (Knapp-USGS)

Descriptors: *Water chemistry, *Water resources, *Surface waters, *Groundwater, *Natural resources, Equilibrium, Chemical reactions, Water quality, Chemical properties, Streams, Lakes, Oceans, Soils, Estuaries, Aquifers, Thermodynamics, Pressure, Water properties, Physiocochemical properties, Aqueous solution, Hydrolysis, Ionization, Solubility, Chemical analysis, Oxidation, Reduction (Chemical), Surface tension, Adsorption.
Identifiers: *Natural waters, Chemical equilibria.

The aims of this book include the formulation of an adequate theoretical basis for the chemical behavior of ocean waters, estuaries, rivers, lakes, groundwaters, and soil water systems, and the description of the processes involved in water treatment. Comparison of the real systems with idealized counterparts or models is made. These simplified and manageable models clearly illustrate the principal regulatory factors that control the chemical composition of natural waters, and in turn, the composition of the atmosphere. Special attention is given to the chemical processes affecting the distribution and circulation of chemical substances, and, the application of elementary principles of physical chemistry in isolating and identifying some of the variables which affect the composition of the water. Descriptors: *Water chemistry, *Sea water, *Hydrogen ion concentration, *Carbon dioxide, Kinetics, Aqueous solutions, Equilibrium, Instrumentation, Water analysis.
Identifiers: Sea water chemistry.

The kinetics of pH change in solutions containing carbon dioxide and in contract with a gas phase were studied by determining the rate of pH change in a vigorously bubbled sample of artificial seawater. Variations in the effective constants with temperature and chlorinity are given, and the results are related to the values for the second dissociation constant of carbonic acid in seawater. The rate constants suggest that the role of the hydroxyl ion reaction is more important at the ordinary pH of the sea than had previously been thought. (Knapp-USGS)

THE MACROBENTHOS OF THE PAMLICO RIVER ESTUARY, NORTH CAROLINA,
North Carolina Water Resources Research Inst., Raleigh; and North Carolina State Univ., Raleigh. Dept. of Zoology.
Kenneth R. Tenore.
Available from NTIS as PB-197 591, $3.00 in paper copy, $0.95 in microfiche. North Carolina Water Resources Research Institute Report No 40, (PhD Thesis), Sept 1, 1970. 113 p, 12 tab, 15 fig, 71 ref, append. OWRR Project B-004-NC (8).

Descriptors: *Benthos, *Estuaries, *Estuarine environment, *Environmental effects, *Water pollution effects, *North Carolina, Plankton, Salinity, Temperature, Dissolved oxygen, Sediments.
Identifiers: *Pamlico River Estuary (NC), Anoxic conditions.

A study of the macrobenthos and its environment in the Pamlico River estuary, North Carolina, included measurements of salinity, temperature, and dissolved oxygen, as well as the particle size and organic matter concentrations of the sediments. Salinity ranged from 1 to 20 o/oo, and temperature from 5 to 31C. Anoxic conditions in the bottom water overlying the deeper portions of t estuary occurred in the late summer. Two distinct sediment types were found: a sand substrate in the shallow area, and a silty clay substrate in the deep area of the estuary. The macrobenthos had both low diversity and low density because of harsh environmental conditions of salinity and sediment composition. The absence of benthic life in much of the deeper portions of the estuary correlated directly with anoxic conditions in these areas. On the basis of trellis diagrams, the estuary was divided into three areas: (1) an oligohaline zone dominated by Rangia cuneata and Nereis succinea, (2) a mesohaline zone with a Macoma balthica-Heteromastus filiformis-Nereis succinea association, and (3) a polyhaline zone at the mouth of the estuary characterized by a Macoma phenax-Mulinia lateralis-Glycera dibranchiata association. Vast seasonal changes appeared in species composition, range of distribution, density, and community delimitation caused by the new set of planktonic larvae in the estuary. A total of 36 species was found during the 1968-1969 sampling program. Except for such species as Rangia cuneata and Nereis succinea, most of the benthos underwent great fluctuations due to recruitment from new set. The macrobenthos undergo significant seasonal cycles in the estuary. This report also includes conclusions and recommendations concerning pollution, dredging, and a proposed highway-hurricane-dam complex across the estuary.

BIOTURBATION OF SEDIMENTS IN A NORTHERN TEMPERATE ESTUARY,
Chicago Univ., Ill. Dept. of the Geophysical Sciences; New Hampshire Univ., Durham. Jackson Estuarine Lab.; and New Hampshire Univ., Durham. Dept. of Earth Sciences.
Judith E. Winston, and Franz E. Anderson.
Marine Geology, Vol 10, No 1, p 39-49, January 1971. 11 p, 2 fig, 3 tab, 7 ref.

Descriptors: *Estuaries, *Bottom sediments, *Benthic fauna, *Sedimentation, *Sedimentary structures, Sediments, Mud, Sands, New Hampshire.
Identifiers: *Bioturbation, Polychaetes.

The amount of bioturbation decreases up the Great Bay estuary as salinities become lower and the bottom-dwelling fauna change in composition. Species of the polychaete genus Nereis appear to be the most important turbation agents. Four different levels of bioturbation were observed, ranging from highly turbate in a sandy bottom marine environment near the mouth of the estuary, to non-turbate in a silty bottom brackish water environment near the head of the estuary. L. A. Nepeina, and A. V. Fursenko.
Translated from Doklady Akademii Nauk SSSR, 1969, Vol 188, No 5, p 1111-1112, September-October. Academy Sciences USSR Doklady, Earth Science Sections, Vol 188, No 1-6, p 213-214, April 1970. 2 p, 2 tab, 3 ref.

Descriptors: *Salinity, *Lagoons, *Bays, Evaporation, Mixing, Streamflow, Water balance, Regression analysis, Water analysis.
Identifiers: *USSR, *Sakhalin.

The water of the Busse Lagoon, Sakhalin, USSR, which is connected with Aniva Bay by a narrow strait and also receives much fresh water from streams and creeks, shows no specific persistent relationship between the components of the salt. Surface and bottom samples were taken at 10 stations. The stations were planned to cover all the more and less fresh-water diluted parts of the lagoon and points most representative of the salinity distribution. The salinity and chlorinity of the Busse Lagoon water were fitted into a relationship by the method of least squares. In the chlorinity range of 16.0 to 17.5 percent, the relationship is for Busse Lagoon water: S (in percent) — -1.6979 plus 1.9079 Cl (in percent). (Knapp-USGS)

SABELLARIA REEF MASSES IN DELAWARE BAY,
Delaware Univ., Newark. Dept. of Biological Sciences; and Delaware Univ., Newark. Marine Lab.
Harry W. Wells.
Chesapeake Science, Vol 11, No 4, p 258-260, December 1970. 3 p, 3 fig, 6 ref.

Descriptors: *Reefs, *Estuaries, *Delaware, *Annelids, Sedimentation, Sedimentary structures, Tides.
Identifiers: *Delaware Bay, *Polychaetes, *Sabellaria reefs.

Along the western shore of Delaware Bay the polychaetous annelid Sabellaria vulgaris builds reefs which are formed of sand grains cemented together in rounded masses of dwelling tubes. They occur principally near the low tide line on sandy beaches in the lower part of the bay, where higher salinity waters, turbulence from wave action, a supply of sand, and a firm or hard substrate occur together. These reefs have important geological and biological effects on the immediate environment, modifying and stabilizing beach sediments, and supporting a distinct community of associated organisms. SALINITY AND WATER CIRCULATION IN THE VELLAR ESTUARY,
Southampton Univ. (England). Dept. of Oceanography; and Marine Biological Station, Porto Novo (India).
K. R. Dyer, and K. Ramamoorthy.
Limnology and Oceanography, Vol 14, No 1, p 4-15, January 1969. 12 p, 12 fig, 2 tab, 9 ref.

Descriptors: *Estuaries, *Water circulation, *Saline water-freshwater interface, Mixing, Tides,

er flow, Stratified flow, Chemical stratification, rents (Water), Temperature, Salt balance.
ntifiers: India, Vellar estuary, Bay of Bengal, nity gradient.

account is given of the results of a 1967 study of Vellar estuary South India, which discharges the Bay of Bengal. More than 2,200 measure-ts each were made of salinity, temperature, and ed and direction of water currents. This typical built estuary is shown, by comparison with ensionless stratification parameters, to be a water wedge at high rates of river discharge. At reased rates of river discharge the estuary omes well-stratified with the net flow reversing epth and both advection and diffusion con-uting importantly to the upstream salt flux. Dur-the tidal cycle, the salt wedge near the bottom omes isolated in a series of basins during ebb The water circulation at high river discharge s is dominated by a meander system of alternat-scour holes, with the high seaward flow in the est areas. Superimposed on this is a secondary al circulation system that breaks down and rses direction at low river flows when the saline r inflow develops. (Lang-USGS)

tifiers: English Channel (England), Southamp-Water (England).

bdenum in samples of sea water from the En-Channel and from different depths at five sta-in the Northeast Atlantic was determined. average concentrations, 11.5 and 10.9 micor-s molybdenum per liter, respectively, for these os of samples are similar to those reported for other ocean waters and results confirm previ-findings that molybdenum is a relatively rmly distributed element in sea water showing minor and irregular variation with position depth. Measurements of molybdenum in the hampton Water estuary were made over a 16-h period. Results show that distribution of the ent was dominantly controlled by the extent of on with river water having a molybdenum ntration (about 0.3 micrograms/liter), a gible amount compared with sea water. The ge ratio of molybdenum to salinity was 0.346 is similar to that for water of the English nel. The ratio was reduced in spring, probably ological activity, but the amount by which it educed was less than 1/5th of the winter level. pears that the amount of molybdenum in sea will considerably exceed biological require-s in most natural situations. CED PLUME IN A STRATIFIED FLUID,
nal Center for Atmospheric Research, der, Colo.
uglas Fox.
al of Geophysical Research, Vol 75, No 33, p -6835, Nov 20, 1970. 12 fig, 1 tab, 22 ref.

riptors: *Buoyancy, *Stratified fluid, *Flow es, *Froude number, Plumes, Eddy viscocity, ulence.
fiers: *Reynolds stress term, *Entrainment, ent fluid, Boussinesq equation, Molecular city.

odel of a forced plume developed is intended arify and improve existing plume theories. Both the classical theories are developed, as is this one, from the assumption that a plume is a fully developed, steady-state phenomenon independent of the source conditions. The Morton model requires the external specification of entrainment. The Priestly and Ball model does not necessarily neglect the continuity equation, and the external specification of entrainment can be achieved in a less arbitrary manner. A turbulent buoyant yet operating in a linearly stratified fluid is investigated. The rate of entrainment of ambient fluid into the plume is found to be an explicit function of the dependent variables such as: the Reynolds stress, the form of the similarity profiles and the local mean densimetric Froude number. The Reynolds stress term is shown to be related to the constant obtained if the entrainment rate is assumed to be proportional to the mean center line velocity. A critical parameter of the analysis is the ratio of the form of the velocity profile to the form of the density difference profile. Values of this parameter near unity seem most appropriate. Numerical solutions are composed with experimental results to suggest values for the Reynolds stress term. (Herrera-Vanderbilt)

3A. Saline Water Conversion

DEVELOPMENT OF DESALINATION MEMBRANES,
General Aniline and Film Corp., Easton, Pa. Central Research Lab.
Herman S. Schultz, and Nathan D. Field.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, Price $1.00. Office of Saline Water Research and Development Progress Report No 609, December 1970. 109 p, 11 fig, 13 tab, 26 ref. OSW Contract 14-01-0001-1807.

Descriptors: *Reverse osmosis, *Membranes, *Synthesis, Desalination, Membrane processes, Osmosis, Waste water treatment, Water purification.
Identifiers: *Copolymers, *Homopolymers, Polyvinyl pyrrolidone, Methyl vinyl ether, Maleic anhydride, Crosslinked films, Diisocyanates.

This report summarizes work on the preparation and evaluation of new reverse osmosis membranes with the objective of finding new polymer reverse osmosis membranes useful for desalinating of brackish and sea water, and/or purification of acid mine and other polluted waters. It was hoped that materials would be found that have a combination of properties superior to those based on cellulose acetate. Water flux, salt rejection, mechanical strength, % water absorption and salt distribution coefficient measurements were used to evaluate the results. Almost all the films studied were of the dense type and the primary focus was on salt rejection rather than water flux. It was felt that materials that showed good salt rejection could be studied subsequently to improve water flux. More specifically, the program consisted of the fabrication of water insoluble membranes based on homo and copolymers of vinyl pyrrolidone and/or vinyl ethers using several broad approaches to be described. Most of the polymers utilized were materials now manufactured commercially by GAF, experimental materials, or reaction products of such materials. Water content and salt distribution coefficient measurements on water-equilibrated films were determined in a number of cases as an aid in evaluating materials. The use of Bierbrich Scarlet dye was found to be a valuable tool for diagnostic purposes beyond the detection of pinholes. (Horowitz-Office of Saline Water)

EFFECT OF POROUS BACKING SUBSTRATES ON MEMBRANE FLUX IN REVERSE OSMOSIS SYSTEMS,
Hydronautics, Inc., Laurel, Md.
Gedeon Dagan, and Arye Gollan.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, Price $0.35. Office of Saline Water Research and Development Progress Report No 614, December 1970. 21 p, 8 fig, 10 ref. OSW Contract 14-30-2528.

Descriptors: *Desalination, *Reverse osmosis, *Permeability, *Porosity, Membranes, Membrane processes, Osmosis.
Identifiers: *Porous supports, *Composite membranes, Pressure drop, Water flux, Salt rejection, Flux decline.

The effect of porous substrate characteristics on the overall performance of a composite reverse osmosis membrane assembly is investigated for the two most representative concepts, classified as the parallel and radial flow pattern systems. Pressure drop, as well as flux decline curves, as functions of physical parameters of the system are presented. The overall performance of a reverse osmosis membrane depends not only upon its transport properties, but also upon the specific physical system in which it is situated. It is the object of this presentation to briefly summarize the coupled effect of the pressure drop in the membrane substrate for the parallel flow case and introduce the study of two radial flow systems. It is believed that these three basic flow patterns exist in most commonly used systems and may serve as first approximations for many other similar assemblies. (Horowitz-Office of Saline Water)

CHARACTERIZATION OF CELLULOSE ACETATE BUTYRATE MEMBRANES,
Universal Water Corp., Del Mar, Calif.
S. Manjikian, and M. I. Foley.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, Price $1.00. Office of Saline Water Research and Development Progress, Report No 612, December 1970. 110 p, 15 tab, 31 fig. OSW Contract 14-30-2517.

Descriptors: *Reverse osmosis, *Permselective membranes, *Membranes, Membrane processes, Separation techniques, Saline water, Pressure, *Desalination, Osmosis.
Identifiers: Cellulose acetate butyrate, Cellulosics, Casting solutions, Flux, Salt rejection.

Three major areas of interest were investigated in this program. These included the characterization of cellulose acetate butyrate membranes, the optimization of cellulose acetate butyrate membranes, the optimization of butyrate membrane performance and the production of tubular butyrate membranes. In addition, work was initiated on CA-CAB bi-membranes and noncellulosic polymers as membrane materials. Exploratory formulations were prepared and tested to evaluate the effect of certain variations in casting solution compositions on membrane performance. These formulations were directed at increasing flux and compaction resistance for butyrate membranes as well as the development of casting solutions which would be suitable for the production of tubular butyrate membranes. Additives to the standard formulation such as glyoxal, have resulted in 50 to 100 percent improvement in membrane flux with an acceptable reduction in membrane selectivity. In addition, membranes of a wide range of properties were prepared from identical casting mixtures by

varying fabrication conditions, specifically, with diethanolamine as an additive. (Kindley-Office of Saline Water)

SURVEY OF THE ION EXCHANGE PROCESS FOR DESALINATION APPLICATIONS.
Control Systems Research, Inc., Arlington, Va.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, Price $1.75. Office of Saline Water Research and Development Progress Report No 616, November 1970. 222 p, 11 tab, 37 fig, 52 ref, 6 append. OSW Contract 14-01-0001-2275.

Descriptors: *Desalination, *Ion exchange, Demineralization, *Resins, Costs, Reviews, Desalination processes, Separation techniques, Waste water treatment, Water supply, Municipal water.
Identifiers: Moving bed systems, Fixed bed systems, Continuous process systems.

The potential for application of ion-exchange resins to the partial demineralization of brackish water is surveyed. The study documents the results of a literature search of systems which have been investigated, systems currently in use and systems under development for the ion-exchange demineralization of impure water. The ion-exchange resin and equipment manufacturing industries were surveyed to obtain up-to-date information on the availability and capability of ion-exchange resins and systems applications. On the basis of this information the most economically attractive fixed-bed and continuous process systems were chosen, and subjected to cost modelling and sensitivity analysis for a range of municipal water supply rates (0.1, 1.0 and 10.0 MGD) based on a selected range of inland brackish feedwater salinities (1500 to 3000 ppm total dissolved solids). Parameters for design considerations are given, together with basic economic assumptions. The study also considers resin variations, regenerent types and physical plant layout. The appendices contain a glossary, conversion tables and a complete bibliography of ion-exchange references. (Miller-Office of Saline Water)

3B. Water Yield Improvement

THE FOREST AS A STOREHOUSE OF CITY WATER, (IN GERMAN),
Vienna (Austria).
Herbert Tomiczek.
Allgemeine Forstzeitung, Vol 81, No 5, p 138-139, 1970. 1 fig, 9 ref.

Descriptors: *Water quality control, *Forests, *Water conservation, Subsurface waters, Runoff, Evaporation control, Filtration.
Identifiers: Vienna (Austria).

Epidemics of cholera and typhoid fever, and other difficulties related to the supply of drinking water experienced by the people of Vienna during the last 100 years are reviewed. The daily per capita use of water in that city increased from 80 liters in 1873 to 416 liters in 1967. The latter rate of consumption demands extraordinary measures among which an important part is attributed to rational forest management. This is particularly true of the regions providing the supply of subterranean water. Forest stands, kept in optimum condition and proper stocking, reduce the loss of water by evaporation and runoff, and serve as natural filters retaining microorganisms. The water conserving role of the forest is appreciably augmented by an enrichment of coniferous stands with broadleaved species. (Wilde-Wisconsin)

HYDROGEOLOGICAL POSSIBILITIES FOR MORE EFFICIENT INTERCEPTION OF GROUNDWATER IN KARST,
Institute for Geological and Geophysical Research, Belgrade (Yugoslavia).
M. Komatina.
Trans. from Vesnik Zavoda Za Geoloska i Geofizicka Istrazivanja, Ser B, No 8, p 83-121. Bulletin of Engineering Geology and Hydrogeology, Ser B, No 8, p 75-110, 1968. 36 p, 14 fig, 3 map, 1 tab, 18 ref.

Descriptors: *Water resources development, *Karst, Water wells, Dams, Reservoirs, Hydrogeology, Grouting, Groundwater movement, Water yield, Discharge (Water), Water balance, Aquifers, Water management (Applied), Water sources.
Identifiers: Horizontal interception galleries, Yugoslavia.

Karst hydrogeology and water development in Yugoslavia are reviewed. Karst terrains have a high hydroelectric potential because of the favorable hypsometric relationships between the water-bearing horizons and the abundant precipitation on their catchment areas. However they are unfavorable from the point of view of making them watertight. In Yugoslavia deep-level sealing is often used, by setting up a grouting apron. In the last 10 years or so comprehensive hydrogeological explorations have been carried out in a number of localities in the Yugoslav karst with the aim of intercepting groundwater for water supplies. Interception is the best way to solve the water supply problems of arid karst regions. While exploratory boreholes are not an efficient method of prospecting, horizontal interception galleries always lead to the development of exploitable quantities of flowing water. Boreholes are particularly unfavorable for exploitation in the littoral karst because they more easily upset the equilibrium between salt and freshwater on pumping. In order to make more efficient use of groundwater in karst, its regime must be artificially regulated. (Knapp-USGS)

INVESTIGATION OF STORM PRECIPITATION PATTERNS OF THE LOS ANGELES RIVER AND SAN GABRIEL RIVER DRAINAGE BASINS AND THE SHIFTS IN THE NA PRECIPITATION PATTERN PRODUC ARTIFICIAL NUCLEATION.
North American Weather Consultants, Calif.

Prepared for Los Angeles County Flood District, NMWC Report No 15-2, June, 196 49 fig, 7 tab, 12 ref.

Descriptors: *Cloud seeding, *Cloud *Storm structure, *Artificial precip *Weather patterns, Chemistry of precip Water resources, Hydrologic cycle, Storm Precipitable water, Rainfall intensity, P maximum precipitation, Rainfall disp California.
Identifiers: *Los Angeles County, San Mountains.

New information on cloud physics and pr tion mechanisms was applied to the clarific natural rainfall distribution and to the ide tion of expected cloud seeding effects in Angeles and San Gabriel River watershed various types of storm conditions. In partic was desired to ascertain why and how some produce heavy intensities of precipitation mountains relative to the valleys and other produce the reverse distribution, a matter siderable concern in the management of flo trol facilities. There was developed in the through mathematical analysis, detailed mo air-flow over a mountain barrier and the precipitation particles from clouds onto the tain surface under a variety of meteorologic ditions. Within the general framework models, formulae were developed in which air mass properties, obtained from rawinso servations taken several hours upwind a Beach Airport and Santa Monica, were rel the difference between mountain area precip rates and those in the upwind valleys. It w cluded that: (1) the employment of the theo storm models as a general guide, and the st regression method as the quantitative asse device, was a rewarding procedure; (2) A DICTION METHOD FOR MAKING HI ACCURATE SHORT TERM QUANTIT PRECIPITATION FORECASTS HAS DEVELOPED ON HISTORICAL DATA; (3) the precipitation prediction method adapted to the evaluation of cloud seeding (Poertner)

copersicum esculentum Mill, Diuron, Linu-
Monolinuron, Metobromuron, Chlorbromu-

ffect was determined of slight differences in
ular structure on the relative toxicities of the
tuted urea herbicides. In preemergence appli-
of six different substituted urea herbicides
iander (Coriandrum sativum L) and tomato
persicum esculentum Mill), the
alogenated compounds were more effective
e destruction of plants than their
genated counterparts. The relative dif-
e in effectiveness was much greater in the re-
coriander which appears to take up less
genated than monohalogenated herbicide.
dihalogenated herbicides were generally
more toxic than their monohalogenated
rparts in postemergence application. It ap-
that selectivity could be due to two factors:
ntial absorption and/or translocation and
ntial metabolism. The fact that tomato is
susceptible to all six herbicides in preemer-
and postemergence applications may in-
first, that this plant has no metabolic
e against this group of compounds and
lly, that it absorbs and translocates them
readily to leaves where they are destruc-
Coriander appears to absorb and translocate
nonohalogenated substituted ureas; the
genated compounds appear to be either not
ily absorbed by roots or less readily trans-
d from root tissue. (Jones-Wisconsin)

IRRIGABLE ACREAGE IN NEW MEXICO AND PROJECTED DEMANDS FOR IRRIGATION WATER,
New Mexico State Univ., University Park. Dept. of Agricultural Economics and Agricultural Business.
Marlin L. Hanson.
Available from NTIS as PB-197 660, $3.00 in paper copy, $0.95 in microfiche. Completion Report, Nov. 1970. 10 p, 3 tab, 3 ref. OWRR Project B-008-NMEX (1).

Descriptors: *Irrigation efficiency, Economics, Regression analysis, Statistical models, Costs, Economic feasibility, *New Mexico.

The land area of nine counties in New Mexico was classified according to its economic potential for irrigated crop production. Crop enterprise budgets were developed for production alternatives on 65 soils in the nine counties. Net returns for representative crop combinations were regressed on four soils and two climatic variables to obtain a predictive equation that was used to rate and classify all soils within the nine counties in four irrigable and two nonirrigable classes. Additional analysis is made possible by use of the predictive equations as soil surveys of the remaining counties become available. (Holmes-Rutgers)

REFORESTATION EFFECTS ON WINTER AND SPRING FLOOD PEAKS IN CENTRAL NEW YORK STATE,
Geological Survey, Washington, D.C.
W. J. Schneider.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 780-787, 1969. 8 p, 4 fig, 7 ref.

Descriptors: *Peak discharge, *Vegetation effects, *Small watersheds, *New York, Vegetation regrowth, Rainfall-runoff relationships, Overland flow, Infiltration, Floods, Runoff, Forest management, Watershed management, Water yield, Statistical methods, Correlation analysis.
Identifiers: Experimental watersheds.

Reforestation of 58% of a small watershed in Central New York reduced winter and spring flood peaks by amounts ranging from 66% in November to 16% in April. Although average reductions of 30% for March and 16% for April are indicated, about one out of seven peaks during these two months is now higher than before the reforestation. The reduction occurred during the 25-year period following reforestation as the 1,250,000 trees planted in 1931 and 1932 grew toward maturity. Since 1958, when crown cover was estimated at 90%, there has been no significant change in the flood peaks. This indicates that the effect of the reforestation on the flood peaks has stabilized and can be expected to remain constant unless the forests are significantly altered. (Knapp-USGS)

STORM RUNOFF FROM FORESTED CATCHMENTS BY SUBSURFACE ROUTES,
Forest Service (USDA), Columbus, Ohio. Northeastern Forest Experiment Station.
R. Z. Whipkey.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 773-779, 1969. 7 p, 2 fig, 14 ref.

Descriptors: *Subsurface runoff, *Overland flow, *Floods, *Peak discharge, *Base flow, Groundwater movement, Hydraulic conductivity, Turbulent flow, Hydraulics, Soil water movement, Flood control, Infiltration, Surface-groundwater relationships.
Identifiers: Subsurface storm runoff.

Subsurface stormflow and not overland flow is the major source of flood flows from wetted, unfrozen forest soils of the Allegheny-Cumberland plateau of the eastern United States. Studies aimed at detaining flow from the catchment showed a need for more knowledge of subsurface flow mechanics and of the nature of the porous medium. Small plot and watershed studies showed greatest quantities and rates of flow from fine-textured soils and lesser amounts from coarse-textured soils. However,

hydraulic conductivity of the soil matrix was too low for the flow to be mass interflow. Further tests showed turbulent storm flow occurred primarily from large biological and structural openings in the profile--even when the soil profile was unsaturated. Further study of soil channel hydraulics is proposed. Preliminary plot treatments using contour trenching and backfilling to break soil channel continuity and soil layers have minimized subsurface storm flow from the catchment region above the trench. INFLUENCE OF SOILS, VEGETATION AND GEOMORPHOLOGY ON ELEMENTS OF THE FLOOD HYDROGRAPH,
Agricultural Research Service, Beltsville, Md. Hydrograph Lab.
H. N. Holtan, and N. R. Creitz.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 755-767, 1969. 13 p, 5 fig, 3 tab, 11 ref.

Descriptors: *Flood forecasting, *Hydrograph analysis, *Routing, *Vegetation effects, *Infiltration, *Water storage, Peak discharge, Discharge (Water), Design flood, Design storm, Flood routing, Geomorphology, Reservoir design, Flood control.
Identifiers: Flood hydrographs.

Infiltration capacity during intermittent rainfall is discussed as a function of storage exhaustion with time. A system is presented for estimating the maximum storage capacity of a given soil and for evaluating vegetation as a modifier of storage availability and its rate of exhaustion. A technique is included for computing infiltration recovery during periods of slight or no rainfall. Techniques are demonstrated for rapid computation of the flood hydrograph, or of peak flows only, through application of a storage constant readily obtainable from previously observed hydrograph recessions. Actual and design storms are compared with observed hydrographs. Suggestions are given for research to provide the parameters necessary for application of both infiltration and flood routing procedures. (Knapp-USGS)

SPRING FLOOD HYDROGRAPH COMPUTATION ON THE BASIS OF DATA ON INFLOW TO THE WATERSHED SURFACE AND INTO THE RIVER SYSTEM,
Gidrometeorologicheskii Nauchno-Issledovatelskii Tsentr, Moscow (USSR).
V. I. Sapozhnikov.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 715-722, 1969. 8 p, 2 fig, 1 tab, 8 ref.

Descriptors: *Flood forecasting, *Snowmelt, *Routing, *Hydrograph analysis, Rainfall-runoff relationships, Climatology, Runoff, Streamflow, Peak discharge, Topography.
Identifiers: USSR.

Schemes which make it possible to compute hydrographs of spring floods for a given inflow to the watershed surface and into the river system, form the basis of runoff forecast methods and calculation of maximum discharge probability. The basic parameters and characteristics of calculation diagrams are determined based on observations from a comparatively dense hydrometeorological network. When determining the inflow of snowmelt water to a basin and calculating its flow down a river system along slopes covered with snow, it is necessary to take into account forest areas, water equivalent of snow cover, snow water storage, areal coverage of snow, air temperature, etc. It is necessary to develop new kinds of observation, such as observation of snowmelt intensity, decrease of the area of snow cover during thawing, intensity of water percolation into the soil, etc., to improve methods of estimating runoff progress during spring floods. THE ESTIMATION OF RUNOFF OF LARGE AND MEDIUM RIVERS PROCEEDING FROM THE RUNOFF OF MINOR RIVERS,
State Hydrological Inst., Leningrad (USSR).
M. I. Gourevitch.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 708-715, 1969. 8 p, 4 fig, 1 tab, 2 ref.

Descriptors: *Rainfall-runoff relationships, *Streamflow forecasting, *Routing, Base flow, Infiltration, Seepage, Streamflow, Runoff, Hydrograph analysis.
Identifiers: Isochrone method, USSR.

A runoff-forecasting method using indicator-basins is proposed. The conditions of the indicator-basins are specified by introducing the notion of homogeneous runoff regions, the time lag is computed, and the dependence of the discrepancy between the observed runoff and that calculated by the isochrones scheme allows calculation of the inaccuracy of the isochrone scheme and the influence of channels unaccounted for by the isochrone scheme. The proposed method can be widely used because the runoff of large and medium rivers may be computed directly from the runoff of small rivers without using rainfall data and infiltration and evaporation losses. (Knapp-USGS)

CALCULATION OF FLOOD DISCHARGES BY MEANS OF THE UNIT HYDROGRAPH,
Ukrainskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Kiev (USSR).
V. I. Mokliak, and T. A. Tchekushkina.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 700-707, 1969. 8 p, 4 fig, 3 tab.

Descriptors: *Flood forecasting, *Unit hydrographs, *Routing, Hydrograph analysis, Discharge (Water), Peak discharge, Hydrographs, Topography, Snowmelt.
Identifiers: Isochrone method, USSR.

The possibility of application of the unit hydrograph to determination of the spring flood discharge is discussed. The hydrograph ordinates are calculated by a specific genetic formula based on construction of isochrones after maximum velocity of water movement in the sections for a given time interval, and on transformation of the discharge in these sections by lag coefficients. A unified UH design allows determination of hydrograph discharges at the outlet at any division of the basin into sections. Whether the process of runoff from all the basin, or the discharge in gaging sections of sub-basins is considered, the hydrograp at the outlet will be the same. The application the suggested unit hydrograph, as shown by calc lated examples, allows solution of the problem the regulating effect of a reservoir system in t basin on spring flood discharges and determinati of the effect of human activity on river flow. napp-USGS)

ON THE CHARACTERISTICS OF FLOODS AN ESTUARY,
Tokyo Inst. of Tech. (Japan).
H. Kikkawa, and H. Shi-igai.
In: Floods and Their Computation, Vol 2, Intern tional Association of Scientific Hydrology Public tion No 85 (Unesco-WMO), p 910-918, 1969. 9 7 fig, 1 tab, 1 ref.

Descriptors: *Estuaries, *Flood control, *Floo forecasting, *Flood routing, *Floodgates, Floo protection, Routing, Tides, Streamflow forecastin Storm runoff, Computer programs.
Identifiers: Japan.

The behavior of floods in an estuary is rather con plicated from the hydrological and hydrodynamic points of view. In particular, the high tides cause by typhons and the functioning of control gates a the most important ones to be treated. Where river is affected by flood and high tides caused b typhoons, the optimum operation of control gat located at the estuary is investigated. The floo routing for a given runoff is also studied for two a tual cases by the use of electronic computers. E forts were made to obtain a stable computin method for high speed and medium speed digit computers with minimum possible computing time and to obtain a satisfactory method of gate opera tion to minimize the maximum water level in th channel. STATISTICAL CORRELATION O HIMALAYAN AND BUNDELKHAND BASIN CHARACTERISTICS WITH FLOOD FLOWS,
Uttar Pradesh Irrigation Research Inst., Roorke (India).
S. N. Gupta, A. P. Bhattacharya, and S. R. Jindal.
In: Floods and Their Computation, Vol 2, Interna tional Association of Scientific Hydrology Publica tion No 85 (Unesco-WMO), p 874-880, 1969. 7 p, 2 fig, 1 tab, 7 ref.

Descriptors: *Rainfall-runoff relationships, *Streamflow forecasting, *Flood forecasting, *Uni hydrographs, *Statistical methods, Probability, Peak discharge, Frequency analysis.
Identifiers: India, Uttar Pradesh, Himalaya, Bundelkhand.

The flood flow for a basin is generally evaluated either by: (1) empirical formulas, (2) statistical or probability methods and (3) unit hydrograph method. Each method utilizes one or more elements of basin characteristics but none can be considered of universal applicability for the prediction of flood discharge. An attempt was made to correlate peak flood derived by the unit hydrograph method for eight Himalayan and Bundelkhand catchments in Uttar Pradesh with catchment area, stream length, average stream slope and length from gaging station to the center of the catchment. The statistical derivation can be applied to ungaged catchments for evaluating flood flow. (Knapp-USGS)

RADIOMETRIC METHOD FOR INVESTIGATING THE PERMEABILITY OF RESERVOIR BEDS (RUSSIAN),
Polish Academy of Sciences, Gdansk. Inst. of Hydraulic Research.
E. Makowski.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/45, p 727-741, 1970. 15 p, 12 fig, 3 ref.

Descriptors: *Reservoir leakage, *Canal seepage, *Tracers, *Radioactivity techniques, Radioisotopes, Tagging, Tracking techniques, Water loss, Density, Groundwater movement, Soil water movement, Percolation, Seepage.
Identifiers: Reservoir leakage tracing.

To locate leaks under large areas of a reservoir or canal bed a method was developed based on the use of radioactive solutions and radiometry. The method consists in introducing a homogeneous cloud of radioactive solution having a higher density than the surrounding water above the bottom of the reservoir, on which it settles after a few minutes. In places where there is an increased seepage rate (leakage of water) there is always a slight suction, which draws the radioactive solution out of the cloud on the bottom into the crevices and pores in the ground and thus causes a decrease in the radioactivity of the surrounding medium in the immediate vicinity. Repeated monitoring of the distribution of the radioactivity on the reservoir bottom then permits location of the leaking areas and the determination of their approximate extent. Descriptions are given of the method of injecting the radioactive solution, the equipment employed, and the measurement technique. An example is given of the practical application of the method in a reservoir (at Pszeczica, Poland), where the leaks occurring were causing damage to some parts of the anti-seepage layer and then to the dam itself. Investigations using the method described allowed precise determination of the location and extent of the leaking areas of the bed, showed the hydraulic link between these areas and the corresponding escape of water in the medium surrounding the dam, permitted determination of the leakage in the anti-seepage layer and confirmed that under the clay anti-seepage layer there are areas of considerable infiltration, which were the direct cause of the damage. NEUTRON INVESTIGATION OF THE RATE OF WATER SEEPAGE FROM IRRIGATION CHANNELS AND RESERVOIRS IN LOESSIAL LOAMS (RUSSIAN),
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
A. I. Danilin.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/49, p 773-784, 1970. 12 p, 6 fig, 2 tab, 5 ref.

Descriptors: *Nuclear moisture meters, *Soil moisture meters, *Reservoir leakage, *Canal seepage, *Loess, Soil water movement, Groundwater movement, Soil density probes, Gamma rays.
Identifiers: *Neutron detectors, Soil density meters.

Experimental field studies on moisture conditions in the ground near an irrigation channel, a reservoir, and the area of ground affected were carried out in the USSR in 1968 with neutron moisture gages and gamma-gamma densimeters. Observations of the moisture movement and soil density were made in permanent boreholes up to 16.5 m deep lined with 2 in. steel tubes sealed at the bottom. An all-purpose probe with a high-efficiency slow-neutron detector and a Pu .. Be neutron source, shows a linear dependence between the thermal neutron count and soil moisture. A portable scaler was used as the measuring instrument. The density probe contained a gamma source with an activity of 2 meq of radium. (Knapp-USGS)

AQUATIC WEED CONTROL,
Robert Blackburn, and Ralph Scott.
Southern Water Resources Conference, 14th Meeting, Miami Beach, July 31-August 2, 1968. Council of State Governments, Southern Office, Atlanta, n d, p 13-15.

Descriptors: *Aquatic weed control, *Water resources development, *Administration, *Herbicides, Planning, Weed control, Alligatorweed, Cutting management, Aquatic weeds, Aquatic plants, Water hyacinth, Vegetation effects, Riparian plants, Floating plants, Governments, State governments, Local governments, Federal government, Legislation, Government finance, Mechanical control, Mechanical equipment, Aerial photography, Remote sensing, Surveys.

Outlining state and federal programs for control of undesirable aquatic plants, this speech at the fourteenth meeting of the Southern Water Resources Council notes that, although herbicidal methods may have a detrimental effect on fish and wildlife, they are less harmful than the uncontrolled plants. The new uses of infrared and color photography from aircraft or satellites to survey and locate areas of plant infestation are mentioned, and traditional and modern mechanical plant control methods are discussed. New federal legislation and appropriations are also mentioned. The text concludes that, in place of a project-by-project approach to aquatic weed problems, a comprehensive nationwide control program is needed to permit early detection and control of serious infestation. RECREATION AND FISH AND WILDLIFE PROGRAM FOR THE STATE WATER PROJECT,
California State Dept. of Water Resources, Sacramento.
David E. Pelgen, and Floyd P. McFadin.
May be obtained from the Dept. of Water Resources, P.O. Box 388, Sacramento, Calif. 95802. Department of Water Resources Bulletin No 117, December, 1968. 31 p, 3 fig, 1 tab.

Descriptors: *Recreation, *Recreation facilities, *Recreation demand, *Wildlife conservation, *Fish management, *California, *Multiple-purpose projects, Water resources development, Conservation, Fish conservation, Social aspects, Water demand.
Identifiers: *California State Water Project.

A proposal is described for implementation of the program of the Department of Water Resources for including recreation and fish and wildlife enhancement features in the State Water Project. The background of the statutory and administrative basis for the program are given, and the present situation is described as well as the Department's schedule for developing recreation and fish and wildlife plans over the next five years within the present framework of the Water Code. The Davis-Dolwig Act of 1961 provided that the development of new recreation sites, along with features that will enhance the State's fish and wildlife resources, be included as a part of the State Water Project. The Act also assigned responsibility for planning such features to the Department of Water Resources. Financing is provided from State Water Project Funds, Tidelands Oil Revenues, and the State General Fund. A number of recreation features have already been constructed at completed Project units. Pertinent sections of the Davis-Dolwig Act are included. The policy of the Resources Agency for carrying out the Davis-Dolwig Program is outlined. (Poertner)

INTRA-YEAR WATER STORAGE,
Arta (Greece).
C. Venetis.
Technometrics, Vol 12, No 4, p 741-749, November 1970. 9 p, 9 ref.

Descriptors: *Stochastic processes, *Water storage, *Seasonal, *River flow, *Monthly, *Markov processes, Reservoirs, Equations, Regulated flow.

The purpose of intra-year water storage was to impose upon the seasonally fluctuating river flows some uniformity in order to secure in a probabilistic sense a certain draft, generally varying with season, during all seasons of the year. Monthly flows of the stochastic structure of equations were considered and the approach was based on Moran's Markov chain concept of the reservoir content fluctuations. For the approximate bivariate Markov chain the seasonal limiting distributions were derived. The distribution of the number of occurrences of emptiness during the critical month in N years of reservoir operation was also examined. This distribution was conditional on the month and state of the reservoir content when the reservoir was assumed to start operating. A simple numerical example was computed in order to illustrate the application of the theory. A two-seasonal model was statistically inferred to represent adequately the stochastic generating process of the seasonal inflows. (Kriss-Cornell)

SURFACE WATER CONTROL IN NEW JERSEY, PART II: DRAINAGE, FLOOD CONTROL AND RELATED POLICIES IN AN URBAN STATE.
Rutgers-The State Univ., New Brunswick, N.J. Bureau of Government Research.

August 1967. 142 p, 5 append.

Descriptors: *New Jersey, *Surface waters, *Administrative agencies, *Water control, Legislation, State governments, Surface runoff, Repulsion (Legal aspects), Riddance (Legal aspects), Judicial decisions, Legal aspects, Erosion, Storm runoff, Cities, Floodwater, Flood control, Water law, Natural flow doctrine, Drainage, Drainage systems, Drainage districts, Watersheds (Basins), Drainage programs, Urbanization, Water policy.

Part II of a two-part report submitted by the New Jersey Bureau of Government Research, this study on surface water control in New Jersey is divided into two chapters: (1) organizational structure and administration, and (2) substantive programs. The first chapter discusses: (1) considerations in formulating organizational recommendations; (2) state level organization as it involves improvements within the present organizational framework, establishing a new department to administer control of surface water, and a modified interagency mechanism; (3) organization below the state level; (4) county level organization, including county water control agencies and employment of a county hydraulic engineer; (5) regional organization and special agencies, including criteria for using regional agencies, watershed districts, drainage districts, and advisory boards; and (6) overview of the organizational structure. The second chapter examines: (1) functions and powers of the control agency; (2) channel encroachments; (3) maintenance of basic channels; (4) regulating storm drainage facilities and controlling downstream problems; and (5) regulation of use and occupancy of flood plains. ISOTOPE TECHNIQUES APPLIED TO GROUNDWATER MOVEMENT IN THE KONYA PLAIN,
State Hydraulic Works, Ankara (Turkey).
F. Senturk, S. Bursali, Y. Omay, I. Ertan, and S. Guler.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/11, p 153-161, 1970. 9 p, 3 fig, 3 tab, 3 ref.

Descriptors: *Tracers, *Deuterium, *Oxygen, *Groundwater movement, Water resources development, Aquifers, Irrigation water, Water sources, Water yield, Groundwater basins, Sampling, Recharge, Discharge (Water).
Identifiers: *Turkey, *Konya plain (Turkey).

As the yields of surface waters in the Konya plain, Turkey decrease noticeably in the summer months the need arises for using groundwater reservoirs for irrigation in the region. The locations of aquifers in the Konya plain were determined by using the stable isotopes oxygen-18 and deuterium. Samples were taken every month at 35 sampling points scattered homogeneously throughout the region. In addition, precipitation samples were collected at three points in the recharge area. The stable isotope values of these samples indicated that two main water bodies with different characteristics existed, one at a shallow and the other at a deeper level, and that they were fed by precipitation of continental type. USE OF GROUNDWATER IN DEVELOPING THE MEKONG DELTA, REPUBLIC OF VIET NAM,
Earth Science Research Corp., Santa Monica, Calif.
Eugene D. Michael.
Groundwater, Vol 9, No 1, p 20-24, January-February 1971. 5 p, 1 fig, 7 ref.

Descriptors: *Conjunctive use, *Surface-groundwater relationships, *Groundwater, *Deltas, *Water resources development, Irrigation, Flood control, Water yield, Water storage, Aquifers, Water wells, Water levels, Saline water intrusion, Artesian wells, Confined water.
Identifiers: *Mekong Delta (Viet Nam), Viet Nam.

The Mekong Delta is underlain by an upper section of recent alluvium, and a lower section of older alluvium. The older alluvium contains a permeable artesian zone called the 100-meter aquifer, which is the most productive groundwater reservoir in Viet Nam. Tested well capacities range from about 145 to 635 gallons per minute (gpm); more efficiently designed wells should produce in the range of 500 to 1,000 gpm from this aquifer. Part of the 100-meter aquifer is intruded by sea water. Storage is estimated to be approximately 30 million acre-feet in the lower Delta, where the total dry season irrigation requirement is about 1.2 million acre-feet. The most feasible plan for development of the Mekong Delta may involve the conjunctive use of surface water and groundwater of the 100-meter aquifer, even though induced recharge and a groundwater barrier against sea-water intrusion might be necessary. (Knapp-USGS)

RECHARGE CHARACTERISTICS OF A WATERCOURSE AQUIFER SYSTEM AT SPRINGFIELD, OHIO,
Geological Survey, Columbus, Ohio; and Ohio Dept. of Natural Resources, Columbus. Div. of Water.
Stanley E. Norris, and Herbert B. Eagon, Jr.
Groundwater, Vol 9, No 1, p 30-41, January-February 1971. 12 p, 9 fig, 5 ref.

Descriptors: *Induced infiltration, *Conjunctive use, *Water yield, *Surface-groundwater relationships, *Ohio, Water resources development, Municipal water, Recharge, Withdrawal, Water level fluctuations, Observation wells, Monitoring, Aquifers, Water wells, Hydrogeology.
Identifiers: *Springfield (Ohio).

An investigation was made of infiltration conditions in the alluvial-filled Mad River valley in the vicinity of the Springfield, Ohio, municipal wells. Most recharge to the 100-foot thick sand and gravel aquifer is from induced infiltration from the Mad River. Local precipitation and natural, down-valley underflow also are important in sustaining the 14 mgd pumping rate. Gaging stations were established at points above and below the well field in the expectation that infiltration losses could be measured directly. Observation-well records covering the 4-year period 1965 through 1968 show that groundwater levels follow an annual cycle, typically rising in the period February through June, when recharge exceeds depletion, and falling during the remainder of the year. The rate of induced stream infiltration is not sufficient to prevent perennial dewatering of the aquifer beneath the streambed. During the 7-month depletion period average infiltration is estimated at 9 mgd and during the 5-month accretion period estimated infiltration is 12 mgd. On the basis of these estimates the infiltration rate for the respective periods is 0.37 and 0.50 mgd per acre, or about 0.35 mgd per acre per foot of depth. (Knapp-USGS)

PENETRATION RADIOACTIVE LOGGING FOR THE STUDY OF NON-SATURATED AND SATURATED AREAS (RUSSIAN),
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
V. I. Ferronskiy, A. I. Avsyuk, G. I. Grinev, V. I. Demchenko, and B. P. Krovopuskov.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/41, p 673-693, 1970. 21 p, 8 fig, 1 tab, 13 ref.

Descriptors: *Soil density probes, *Radioactive well logging, *Core drilling, Boreholes, Gamma rays, Neutron absorption, Soil moisture meters, Nuclear moisture meters, Sediments, Sedimentology, Soil moisture, Soil water, Geology, Mineralogy, Instrumentation.
Identifiers: *Soil probes (Penetration), Penetration radioactive logging.

A new method of radioactive logging for the study of non-saturated and saturated areas, as well as sea bottoms is based on the insertion of a logging probe to a depth of up to 30 meters. A description is given of the special penetration logging devices used in the field. A combination of radioactive logging and penetration methods provides complete information on the physical and mechanical properties of non-saturated and saturated ground. The characteristics and resolving powers of the gamma, gamma-gamma and neutron-neutron logging methods were investigated. Penetration methods have advantages over radioactive borehole logging methods. No drilling is required, and the results of the determinations made are more accurate. Examples are given of the application of penetration logging methods for the study of various areas in arid and humid regions in connection with irrigation projects. Examples are also given of the study of silts and sandy sediments as well as bottoms covered with silt at the Black Sea coast. Penetration logging data were interpreted for the determination of the lithological composition and the structure of the geological profile, the physical characteristics (volumetric weight and moisture content) of soils, and the spatial distribution of these characteristics in non-saturated and saturated areas. They were also interpreted for the determination of the position of water-bearing strata in the profile and the salt content of the groundwater, and used in wetting tests. (Knapp-USGS)

PLANNED UTILIZATION OF GROUNDWATER BASINS: COASTAL PLAIN OF LOS ANGELES COUNTY,
California State Dept. of Water Resources, Sacramento.
Kiyoshi Mido.
Department of Water Resources, Bulletin No 104, September 1968. 25 p, 13 fig, 6 tab.

Descriptors: *Groundwater basins, *Conjunctive use, *Surface waters, *Surface-groundwater relationships, *Aquifers, Water costs, Water management, Water transfer, Water demand, Coastal plains, Planning, Urbanization, Municipal water, Water supply, Aqueducts, Colorado River Aqueduct, Los Angeles Aqueduct, California.
Identifiers: *Los Angeles County.

Four alternative plans of conjunctive use of ground and surface water resources to meet future water requirements in the service area were analyzed. From this analysis, understanding evolved regarding the economic impact of pumping schedule and pattern, spreading schedule of imported water, and methods of preventing sea-water intrusion. The most significant economic factors are the price of imported water and the proportionate use of imported water and groundwater in storage. The water demand of the Coastal Plain of Los Angeles County is approximately 860,000 acre-feet a year at present and is expected to grow to 1,200,000 acre-feet by 1990. Water supply from various sources which include the Los Angeles Aqueduct, the Colorado River Aqueduct, and soon the State Water Project, will be adequate at least until 1990. One of these sources of supply is the ground water basin in the Coastal Plain. Approximately 35 million acre-feet of fresh water is believed to be in storage at present. (Poertner)

4C. Effects on Water of Man's Non-Water Activities

EFFECTS OF A CAUSEWAY ON THE CHEMISTRY OF THE BRINE IN GREAT SALT LAKE, UTAH,
Geological Survey, Salt Lake City, Utah.
R. J. Madison.
Available from Utah Geological and Mineralogical Survey, Univ. of Utah, Salt Lake City. 84112-Price $2.50. Utah Geological and Mineralogical Survey Water-Resources Bulletin 14, September 1970. 52 p, 13 fig, 7 tab, 14 ref, 3 append.

Descriptors: *Great Salt Lake, *Utah, *Water quality, *Bridges, *Environmental effects, Rock foundations, Rock fills, Porous media, Salinity, Brines, Chemical analysis, Water analysis, Dissolved solids, Data collections, Construction, Water chemistry, Evaporation, Water circulation.
Identifiers: *Railway causeway (Great Salt Lake), *Water quality changes (Great Salt Lake).

During 1957-59, a permeable rockfill causeway was constructed for trains to cross Great Salt Lake, Utah. The causeway divides the lake into two parts and interrupts the formerly free movement of brine about the lake. The causeway has caused significant changes in the chemistry of the lake, including a dilution of the brine in the south part of the lake and a concentration of the brine in the north part. The net movement of dissolved-solids load through the causeway is dependent upon the relationship between the ratio of water discharges in each direction and the concentration of dissolved solids. Estimates made for the 1969 water year indicated that the ratio of total flow northward to total flow southward was about 11:1 through the culverts and about 3:1 through the causeway fill. Discharge through the culverts accounted for about 45 percent of the total brine moving northward but only about 15 percent of the total brine moving southward. (Woodard-USGS)
W71-04369

GEOLOGY FOR ENVIRONMENTAL PLANNING IN MONROE COUNTY, MICHIGAN,
Wayne State Univ., Detroit, Mich. Dept. of Geology.
Andrew J. Mozola.
Michigan Geological Survey Report of Invesitgation 13, 1970. 34 p, 18 fig, 6 plate, 2 tab, 48 ref, append.

Descriptors: *Hydrogeology, *Urbanization, *Michigan, City planning, Water management (Applied), Water resources development, Aquifers, Geology, Water levels, Glacial drift, Waste disposal, Water sources, Water supply, Waste water disposal, Septic tanks.
Identifiers: *Monroe County (Mich).

Monroe County, situated in the extreme southeast corner of Michigan, is underlain by Paleozoic rock strata dipping gently northwest. The bedrock stratigraphic sequence consists largely of carbonate rocks with some sandstones and shales. The bedrock surface is almost completely veneered by glacial drift varying in thickness from a few inches to nearly 160 feet. Over most of the county, however, the drift is considerably less than 30 feet. Only a few natural rock exposures occur at widely scattered localities. Throughout most of the county, except principal urban areas, domestic water supplies are obtained primarily from wells completed in bedrock; and wastes are deposed in septic tanks. The groundwater resource, therefore, is particularly vulnerable to contamination. Knowledge of geologic conditions then becomes a crucial consideration in land-use planning. Accompanying the report is a series of half-inch-to mile county maps depicting bedrock geology, bedrock topography, drift thickness, glacial geology, and piezometric water level. A small bedrock map of the state and a stratigraphic nomenclature chart are also included. (Knapp-USGS)
W71-04370

CHANGE OF RUNOFF DUE TO URBANIZATION,
Public Works Research Inst., Tokoyo (Japan).
T. Kinosita, and T. Sonda.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 787-796, 1969. 10 p, 9 fig.

Descriptors: *Urbanization, *Cities, *Rainfall-runoff relationships, Gaging stations, Streamflow, Model studies, Mathematical models, Routing, Flood routing, Hydrographs, Hydrograph analysis, Synthetic hydrology, Flood forecasting.
Identifiers: Tokyo, Japan.

The Public Works Research Institute (Japan) set up a hydrological network on the Syakuzii river basin in the suburbs of Tokyo to find out changes of runoff due to urbanization. This basin is composed of diluvial deposits, and its area is 48 sq. km. Increase of total flood volume, increase of peak discharge and decrease of travel time are caused by decrease of infiltration area, decrease of roughness ground surface and decrease of inundation area due to urbanization. The basin was divided into subbasins and measured by aerophotographs. Floods in 1966 were computed using a storage-runoff relation which contains formulas of drainage channels and the rate of infiltration area. As the computation agreed well with observation, floods were estimated for the case of complete urbanization. (Knapp-USGS)

WHERE IS URBAN HYDROLOGY PRACTICE TODAY,
Department of Housing and Urban Development, Washington, D.C.
D. Earl Jones, Jr.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY2, Paper 7917, p 257-264, February 1971. 8 p, 15 ref.

Descriptors: *Urbanization, *Rainfall-runoff relationships, *Water management (Applied), *Drainage systems, *Sewers, Utilities, Planning, Storm runoff, Storm drains, Runoff forecasting, Rational formula, Routing, Reviews.
Identifiers: *Urban hydrology.

The evolution of urban street construction and its effects upon urban drainage is reviewed. Rational method development and inconsistencies in its application are summarized. Lack of absolute precipitation data inhibits development of improved runoff prediction methods. Urban drainage areas need dual drainage systems to reduce drainage costs, reduce flood losses, to enhance property values, stabilize neighborhoods, and improve urban life quality. Some basic methods for managing urban runoff also attenuate peak flows. A low maintenance channel is more useful than usual urban channel designs. Direct losses from and expenditures for urban drainage approximate four billion dollars per year. The nation could realize disproportionately great returns from urban hydrology research. (Knapp-USGS)

5A. Identification of Pollutants

ESTIMATION OF ADSORBABLE SOLUTES IN SEAWATER WITH C-LABELLED PHENOL AND ACTIVATED CARBON,
Woods Hole Oceanographic Institution, Mass.
Ralph F. Vaccaro.
Environmental Science and Technology, Vol 5, No 2, p 134-138, February 1971. 5 p, 3 fig, 4 tab, 20 ref.

Descriptors: *Water chemistry, *Sea water, *Organic matter, *Adsorption, *Phenols, Solutes, Aqueous solutions, Laboratory techniques, Activated carbon, Water analysis, Kinetics.
Identifiers: Sea water chemistry.

A C-14 tracer technique is proposed by which the kinetics of short-term uptake of labeled phenol on activated carbon provide a quantitative estimate of the adsorbable material in seawater. The method is calibrated by measuring the amounts of C-14 phenol adsorbed under defined conditions in seawater pretreated with activated carbon to completely remove responsive solutes of natural origin. Kinetics relating phenol adsorption to solute concentration show a saturation-type uptake pattern not unlike that described by the Langmuir equation for an equilibrium situation. For sample analysis, the degree of displacement of the phenol calibration curve is evaluated. Shipboard analyses indicative of the remote Atlantic are compared with simultaneous measurements of total dissolved organic carbon obtained with wet combustion. Since the carbon concentrations measured are similar in magnitude, the bulk of the dissolved organic carbon at locations far removed from shore appears to respond to activated carbon in a manner similar to that of phenol. (Knapp-USGS)

CONTINUOUS EXTRACTION OF ORGANIC MATERIALS FROM WATER,
Geological Survey, Denver, Colo; and Federal Water Quality Administration, Edison, N.J.
Marvin C. Goldberg, Lewis DeLong, and Lloyd Hahn.
Environmental Science and Technology, Vol 5, No 2, p 161-162, February 1971. 2 p, 1 fig, 3 ref.

Descriptors: *Solvent extractions, *Analytical techniques, *Water analysis, *Organic matter, Monitoring, Solutes, Colloids, Separation techniques, Immiscibility, On-site tests, Data collections, Water quality, Organic compounds, Solvents.
Identifiers: *Dissolved organic matter sampling.

A continuous liquid solvent extractor, designed to utilize organic solvents that are heavier than water, is described. The extractor is capable of handling input rates up to 2 liters per hour and has a 500-ml. extractant capacity. Extraction efficiency is dependent upon the p-value, the two solvent ratios, rate and flow of the aqueous phase, and rate of reflux of the organic phase. Extractors can be serially coupled to increase extraction efficiency and, when coupled with a lighter-than-water extractor, the system will allow the use of any immiscible solvent. (Knapp-USGS)

THE IMPACT OF LEAD-ZINC MINING ON THE QUALITY AND ECOLOGY OF SURFACE WATERS IN SOUTHEAST MISSOURI,
Missouri Water Resources Research Center, Rolla; and Missouri Univ., Rolla.
Ernst Bolter.
Available from NTIS as PB-197 528, $3.00 in paper copy, $0.95 in microfiche. Completion Report, Missouri Water Resources Research Center, December 1970. 76 p, 3 tab, 19 fig, 38 ref, 6 append. OWRR B-021-MO (2).

Descriptors: Water pollution, Mining industry, *Heavy metals, Analytical techniques, Geochemistry, Copper, *Spectroscopy, Missouri, *Mine wastes, *Pollutant identification.
Identifiers: Lead, Zinc, Viburnum Trend (Mo).

The background concentrations were determined for copper, lead, and zinc in the streams of the Viburnum Trend or New Lead Belt of Southeast Missouri. Analytical methods were developed for atomic absorption spectroscopy. These methods initially consisted of coextraction of copper, lead, and zinc using the APDC/MIBK system, and finally of extraction of copper by APDC/MIBK and direct analysis of lead and zinc using the newly developed 'Sampling Boat' technique. The data obtained from these analyses were arranged in histograms and critically analyzed. The background concentrations were established to be 4-6 ppb for all three elements. Methods are presented for identifying both short term and long term contamination by using the data distributions. Short term contamination of a factor of 2-3 was determined to occur on the Bee Fork below the St. Joseph Lead Company's Fletcher Mine. The data distributions were not useful for geochemical prospecting under the studied geological conditions. It is recommended that future studies be initiated in order to establish the degree of long term contamination introduced by the industrialization of this scenic area. (See also W71-04538)
W71-04537

GEOCHEMICAL EFFECTS OF MINING POLLUTION ON THE STREAMS OF SOUTHEAST MISSOURI,
Missouri Univ., Rolla; and Missouri Water Resources Research Center, Rolla.
Ernst Bolter, and Nicholas H. Tibbs.
Available from NTIS as PB-197 531, $3.00 in paper copy, $0.95 in microfiche. Completion Report, Missouri Water Resources Research Center. OWRR Project A-023-MO (1).

Descriptors: Water pollution, Mining, *Heavy metals, Geochemistry, Streams, Analytical techniques, Missouri, Copper, *Mine wastes, *Pollutant identification.
Identifiers: Lead, Zinc, New Lead Belt (Mo).

Streams in the 'New Lead Belt' of SE Missouri were analyzed for copper, lead and zinc. This area, which a few years ago was sparsely settled and not industrialized, is rapidly developing into the largest lead-zinc mining district of the United States. The data of this study were compared to the results of a pre-mining investigation to determine if the mining activity contributed to the pollution of the streams by heavy metals. Data from an individual mine indicate that the milling waste waters can increase the heavy metal content of the receiving stream up to seven times. However, the heavy metal content of the stream decreases to background concentrations within a distance of three miles. The summarized data of the total area do not indicate a noticeable increase of the heavy metal content in the streams. The average concentrations in the streams at the time of the present investigation were 5.3 ppb for copper, 8.9 ppb for lead and 9.5 ppb for zinc. The calcium content is in the range of 2.45 ppm. The magnesium content in the range of 1-30 ppm. The pH of the streams ranges from 7.0-8.8. It is concluded that the mining activity presently does not significantly pollute the streams with heavy metals. (See also W71-04537 and W71-04182)
W71-04538

DISSOLVED FATTY ACIDS IN THE JAMES RIVER ESTUARY, VIRGINIA, AND ADJACENT OCEAN WATERS,
Virginia Inst. of Marine Science, Gloucester Point.
T. B. Stauffer, and W. G. MacIntyre.
Chesapeake Science, Vol 11, No 4, p 216-220, December 1970. 5 p, 4 fig, 1 tab, 13 ref.

Descriptors: *Organic acids, *Estuaries, *Sea water, *Lipids, Organic compounds, Sampling, Water analysis, Chromatography, Gas chromatography.
Identifiers: *James River (Va), *Fatty acids.

Waters of the James River estuary and adjacent continental shelf were sampled at 34 locations. Dissolved fatty acids were analyzed by gas-liquid chromatography. Total acids generally ranged from 10-25 micrograms per liter while individual fatty acids ranged from 1-4 micrograms per liter. The C14 and C16 chain lengths were dominant for saturated fatty acids, and C14, C16, and C18 were the most common in unsaturated acids. The proportion of odd-numbered chain-length C15 acid was found to be greater in the estuarine than in shelf water. Differences between fatty-acid concentrations of estuarine and ocean water were not sufficient to serve as distinguishing characteristics for these water masses. (Knapp-USGS)
W71-04586

BIOGEOCHEMISTRY OF TRACE ELEMENTS IN A COASTAL PLAIN ESTUARY: DISTRIBUTION OF MANGANESE, IRON, AND ZINC IN SEDIMENTS, WATER, AND POLYCHAETOUS WORMS,
Bureau of Commercial Fisheries, Beaufort, N.C. Center for Estuarine and Menhaden Research.
Ford A. Cross, Thomas W. Duke, and James N. Willis.
Chesapeake Science, Vol 11, No 4, p 221-234, December 1970. 14 p, 9 fig, 8 tab, 34 ref. AEC Contract AT (49-7)-5.

Descriptors: *Trace elements, *Estuaries, *North Carolina, *Water chemistry, *Distribution patterns, Water circulation, Geochemistry, Water temperature, Salinity, Tides, Currents (Water), Bottom sediments, Aquatic animals, Annelids.
Identifiers: *Newport River Estuary (NC).

The distribution of manganese, iron, and zinc in sediments, water, and in six species of polychaetous worms is described for the Newport River estuary near Beaufort, North Carolina. Concentrations of manganese, iron, and zinc in 0.1 N HCl extracts of sediment samples collected monthly from three stations for 2 years varied with element, location, time, and sediment type. At each station, iron was the most abundant element present in the 0.1 N HCl extracts and zinc was the least abundant. The concentrations of all three elements in the sediments decreased in a seaward direction. The relative order of enrichment of trace metals in sediment when compared with water was zinc, iron, and manganese. The order of enrichment of trace metals in polychaetes relative to sediment and water was zinc, iron, and manganese. (Knapp-USGS)

MEASURE AN OIL SLICK - AND DISPERSE IT HARMLESSLY.

New Scientist, London, Vol 47, No 716, p 420, August 27, 1970.

Descriptors: *Oil wastes, *Infrared radiation, Solvents, Surfactants, Oily water, Pollutant identification, *Remote sensing.
Identifiers: *Oil slick detection, *Dispersants.

Infrared scanning is being used for accurate plotting of the position and size of oil slicks at sea. Infrared scanner trials over the Santa Barbara Spill demonstrated that oil shows up clearly on the scanner. Considerable progress is also being made in the development of oil dispersants, solvents and surfactants which are harmless to aquatic life. The British Board of trade has authorized the use of several new dispersants at various sites on the coasts of the United Kingdom. (Ensign-PAI)

SHELL SPOTS OIL SPOTS.

Chemical Week, 107 (9), p 15, August 26, 1970.

Descriptors: *Oil wastes, *Pollutant identification, *Monitoring, Oily water, Electronic equipment, Instrumentation, Light intensity.
Identifiers: *Oil detection device, Shell Oil Company, Photocell measurement.

Shell Development scientists at the Emeryville (California) Research Center have come up with a sensitive electronic instrument that can spot minute quantities of hydrocarbon pollutants in water. Tests conducted recently in San Francisco Bay and in southern California near Wilmington, prove the instrument is sensitive enough to detect the presence of six drops of waste oil that was added about 30 feet above the system in a stream moving one ft./second. After detecting the oil, the device sounds an alarm at a remote control station. (Ensign-PAI)

SOME TIME AND SPACE RESOLUTION REQUIREMENTS FOR SPACE OCEANOGRAPHY,
Bureau of Commercial Fisheries, Galveston, Tex.
Robert E. Stevenson.
Advances in Instrumentation Vol 24, Part III. Instrument Society of America. Twenty-fourth Annual Conference Proceedings, Houston, Texas, October 27-30, 1969, p 4. 2 fig, 7 ref.

Descriptors: *Sewage, *Outlets, *Remote sensing, *Aerial photography, Eddies, Pollutant identification.
Identifiers: Space surveys, Coastal pollution.

Spatial resolution and intervals of repetition necessary for optimum utilization of space-derived, remotely sensed data of ocean surface features were determined from photographs taken from manned space flights. Coastal waters place the greatest demands on this space system. Coastal eddies that form sequences of von Karman vortices are some of the ocean surface features that have periods, sizes and enough energy to contribute to local environments. Study of three submarine outlets that carried one billion gallons of sewage to the sea indicated a $1 million per year advantage if daily data were available on the near shore eddy system. (Ensign-PAI)
W71-04801

ANALYTICAL METHODS FOR THE IDENTIFICATION OF THE SOURCE OF POLLUTION BY OIL OF THE SEAS, RIVERS AND BEACHES.

Journal of the Institute of Petroleum, Vol 56, No 548, p 107-117, March 1970. 8 fig, 1 ref.

Descriptors: Water pollution sources, *Analytical techniques, Oil, Oil wastes, *Pollutant identification.
Identifiers: *Identification methods, Sample collection procedures, Recovery procedures, *Oil pollution, Coastal pollution.

Methods of identifying sources of oil pollution are presented. Some of the methods have not yet been standardized but have been found satisfactory in oil company laboratories. Method details are given so other laboratories can carry out the analysis. Sample collection procedures, oil recovery procedures and recovery of other extraneous matter in pollutant samples are briefly discussed. (Ensign-PAI)

OCCURRENCE OF FALSE-POSITIVE MOST PROBABLE NUMBER TESTS FOR FECAL STREPTOCOCCI IN MARINE WATERS,
Connecticut Univ., Storrs. Microbiology Section; and Connecticut Univ., Noank. Marine Research Lab.
John D. Buck.
Applied Microbiology, Vol 18, No 4, p 562-565, October 1969. 1 tab, 17 ref.

Descriptors: *Sewage wastes, Microorganisms, Indicators, *Pollutant identification.
Identifiers: *Fecal streptococci, *Most probable number tests, Azide dextrose, Ethyl violet azide.

Applying the most probable number technique with azide dextrose and ethyl violet azide broths for enterococci, the occurrence of false positive test was common in marine and estuarine water samples. Marine bacterium, gram-positive and gram-negative nonmarine bacteria and yeasts were isolated. All cultures demonstrated growth in azide-dextrose, ethyl violet-azide, and K. F. broths. Representative isolates grew in media containing 0.08% NaN3. The value of the most probable number method for fecal streptococci is questionable in assessing domestic waste levels in estuarine waters. (Ensign-PAI)

5B. Sources of Pollution

ADSORPTION OF ISOCIL AND BROMAC FROM AQUEOUS SOLUTION ONTO SOM MINERAL SURFACES,
Oregon State Univ., Corvallis. Dept. of Agric tural Chemistry; and Oregon State Univ., Corval Environmental Health Sciences Center.
Rizwanul Haque, and William R. Coshow.
Environmental Sciences and Technology, Vol No 2, p 139-141, February 1971. 3 p, 2 fig, 2 t 10 ref.

Descriptors: *Adsorption, *Herbicides, *Cl minerals, Illite, Montmorillonite, Humic aci Kaolinite, Silica, Kinetics, Hydrogen bonding, Pa of pollutants, Pesticide kinetics.
Identifiers: *Uracil herbicides, Isocil, Bomacil.

Adsorption of two uracil herbicides, isocil a bromacil, from aqueous solution on illite, mo morillonite, silica gel, humic acid, and daolinte s faces was studied. The adsorption can best represented by Freundich-type isotherms. A hum

acid surface adsorbs considerably more chemical than other surfaces. Montmorillonite and daolinite show a concave-type adsorption, while humic acid exhibits a convex-type. From the adsorption data at two temperatures, the isosteric heats of adsorption as a function of amount of chemical sorbed were calculated. These results suggest a physical-type adsorption for most of the surfaces. At very low surface coverage there is also some hydrogen-bond formation. (Knapp-USGS)

the Pocatalico River basin of West Virginia, excessive salt concentration in streams and in shallow oundwater has been a problem for some time. ne recent use of hydraulic-fracturing techniques improve the permeability of the area's oil-oducing rocks has caused increased drilling. uch salt brine, as much as 80 bbls of brine for one l of oil, is generally produced with this oil, creatg a brine storage and disposal problem. A number brine-disposal wells have been drilled for re-inction of the oil-field brines into the 'Injun sand' d the shallower 'Salt sands' (Pottsville Group). lt brine, oil, or gas are present everywhere in the lt sands. There is sufficient natural hydraulic ad (pressure) on brine in the Salt sands to coninate overlying fresh-water horizons unless all lls tapping the Salt sands are permanently and perly cased into the Salt sands in this area. RMAL PROBLEMS: 'OLD HAT' IN TAIN,
ral Electricity Generating Board, London (End).
Hawes.
ral Electricity Generating Board Newsletter, 3, June 1970. 8 p, 2 fig, 4 tab.

riptors: *Thermal pollution, *Power plants, ution abatement, Foreign design practices, Cooling towers, Oxygenation, Environmental effects, Temperature.
Identifiers: British power stations, Heat disposal.

Cooling water requirements of modern fossil-fuelled plants and of the advanced gas cooled reactors now under construction in Britain are about 120 CFS per 100 MW. Because of the small volumes of water in the rivers in Britain, the electric utilities became interested many years ago in water conservation. Experience gained in Britain could be pertinent to us. The cost of constructing a modern tower-cooled system is considered to be 30 percent more than a direct system of equivalent capacity on the same site. The well-aerated discharge from cooling towers is locally beneficial to a river deficient in oxygen. The reduction in density due to heating is the most important property of heated discharge. The formation of a heated surface layer can be influenced by winds, and special outfall design may be required. A deep intake can prevent the warmed water from recycling. Recently, heat has been injected into physical models to obtain more realistic assessments of the behavior of heated effluents. In theory there is a sound basis that the addition of heat to a river will reduce the solubility of atmospheric oxygen, increase the rate at which oxygen will dissolve into water and increase the rate at which oxygen is used in biological processes. In fact, the oxygen is never decreased between intakes and outfalls of power stations. The occurrence of good angling at the outfalls of many stations suggests that fish can select temperatures they prefer and avoid those they do not. Excessive restrictions can increase electricity costs or result in the inefficient use of natural resources. (Upadhyaya-Vanderbilt)

NITRATES IN PLANTS AND WATERS,
Wisconsin Univ., Madison. Dept. of Soil Science.
D. R. Keeney.
Journal of Milk and Food Technology, Vol 33, No 10, p 425-432, 1970. 1 fig, 7 tab, 54 ref.

Descriptors: *Nitrates, *Plants, *Water, Water pollution sources, Animals, Nitrogen cycle, Fertilizers, Wells, Cropping, Groundwater, Plants, Toxicity, Nitrites, Soils, Mortality, Denitrification, Vegetable crops, Agriculture, Industrial wastes, Organic matter, Ammonification, Nitrification.
Identifiers: Roughage, Methemoglobinemia, Nitrate reductase, Chemo denitrification.

High concentrations of nitrates in waters have been linked to methemoglobinemia in infants, and nitrates in waters and roughage have long been recognized as a cause of animal health deterioration. The problems associated with high concentrations of nitrates in the environment and the forms of nitrogen, transformation of nitrogen in soils and waters, sources of available nitrogen, nitrate movement in soils, and nitrate content of plants are reviewed. Nitrate content of many vegetables appears to be related to factors difficult to control when economically feasible yields are desired. The increase in nitrogen fertilizer usage and waste disposal methods have the greatest impact on nitrate levels in groundwater. The effect of high nitrate concentrations in water, methods to minimize the nitrate content of fresh and processed vegetable products are fields for research as well as investigations to evaluate the effect of high nitrate foods on human beings and on edaphic, genetic, cultural, and processing methods to reduce nitrates in vegetables. RADIOACTIVITY IN CALIFORNIA WATERS JULY-DECEMBER 1968.
California State Dept. of Public Health, Berkeley. Bureau of Radiological Health.

Radiological Health Data and Reports, p 400-401, 1970. 1 fig, 1 tab, 1 ref.

Descriptors: *Radioactivity, *California, *Water, Analytical techniques, Surface waters, Wells, Streams, Sewage, Industrial wastes, Fallout, Reservoirs, Sampling, Monitoring, Gamma rays, Radium radioisotopes, Strontium radioisotopes, California.
Identifiers: Beta radioactivity, Alpha radioactivity.

California's domestic water supplies, mainly of surface origin, contain natural radioactivity in surface streams, radioactivity added by sewage discharge or by industrial waste effluents, and radioactivity from fallout, particularly fallout into open terminal or distribution reservoirs. Gross beta radioactivity in California domestic waters is monitored by California's Bureau of Radiological Health. A few wells, along with some water supplies that use infiltration galleries, are also sampled. This monitoring is on a continuing basis, since it has not been possible to forecast radioactivity levels in these supplies based upon levels in rain, snow, or surface streams. Monthly 500-ml samples are collected and total solids analyzed for alpha and beta radioactivity. Specific radionuclides are determined semi-annually on composite samples. Gamma-ray emitting nuclides are determined by gamma-ray spectroscopy and radium and radiostrontium by chemical separation and counting. The monthly average beta radioactivity in the suspended-plus-dissolved solids in surface water supplies in California from July through December 1968 are presented. Alpha radioactivity has, usually, been undetectable or very slight. Radioactivity in surface water remains low. No increase has been observed in drinking water due to nuclear device testing during the past several years. (Jones-Wisconsin)

THE MOVEMENT OF NITROGENOUS FERTILIZERS THROUGH SOIL COLUMNS,
Bureau of Reclamation, Fresno, Calif.
John W. Williford, Thomas C. Tucker, Robert L. Westerman, and Doyle R. Cardon.
In: Collected Papers Regarding Nitrates in Agricultural Waste Waters, Federal Water Quality Administration Water Pollution Control Research Series 13030ELY 12/69, p 29-39, December 1969. 11 p, 1 fig, 9 tab. FWQA Project 13030ELY.

Descriptors: *Leaching, *Nitrates, *Soil water movement, *Fertilizers, *Irrigation effects, California, Path of pollutants, Lysimeters, Model studies, Hydraulic models, Drainage programs, Drainage water, Water pollution sources.
Identifiers: *Central Valley (Calif), *Groundwater pollution.

To study movement of nitrates in soil systems, 14 lysimeters made of techite (fibre glass) pipe 15 inches in diameter and 6.7 feet in length were filled with four major soil types from the west side of the San Joaquin Valley of California. The volumes extracted from the probes and collected in the leachates were recorded. All of the samples were analyzed for chlorides, ammonia, total nitrogen and atom percent excess N. The nitrate levels in leachates collected during initial leaching and before fertilization ranged from 20,000 ppm in the Oxalis clay to 2,500 ppm in the Panoche fine sandy loam. These high nitrate levels indicate how relatively low levels of native nitrates can be concentrated in the groundwater by leaching. The highest percentage of fertilizer -N was leached from soils to which KNO3 was applied. In Panoche fine sandy loam and Lethent sandy clay loam, respectively, 82 and 65% of the total nitrogen collected in the soil extract was fertilizer-N. By comparison, only 14 to 24% of the N in the extract was fertilizer -N when ammonium sulfate and sulfur-coated urea were the N sources. Much of the added NH4-N is tied up by the clay complex of the soil near the soil surface. Since only 30% of sulfur-coated urea was readily soluble and the remainder was treated to dissolve slowly, movement of nitrogen as urea could be expected to be approximately 30% of N movement from KNO3 assuming appreciable hydrolysis did not occur. AGRICULTURAL NITRATE REDUCTION AT A WATER TABLE,
Agricultural Research Service, Brawley, Calif. Southwestern Irrigation Field Station.
L. S. Willardson, and Burl D. Meek.
In: Collected Papers Regarding Nitrates in Agricultural Waste Waters, Federal Water Quality Administration Water Pollution Control Research Series 13030ELY, 12/69, p 41-52, December 1969. 12 p, 6 fig, 2 ref. FWQA Project 13030ELY.

Descriptors: *Leaching, *Nitrates, *Soil water movement, *Fertilizers, *Irrigation effects, California, Path of pollutants, Lysimeters, Model studies, Hydraulic models, Drainage programs, Drainage water, Water pollution sources.
Identifiers: *Central Valley (Calif), *Groundwater pollution.

Laboratory studies on large soil columns with a controlled water table and submerged drains show that very low nitrate content water can be delivered from agricultural drains. A field experiment on drain submergence which intercepts groundwater high in native nitrate indicates that denitrified water from irrigated agriculture can reduce nitrate concentrations in drainage water by dilution. Where proper conditions can be established, including oxygen shortage, adequate organic carbon as an energy source, and a bacterial population, anaerobic conditions develop and result in denitrification. Based on the results obtained in the columns, a nitrate-nitrogen content of 500 ppm in the groundwater would require a surface application of 1,000 pounds per acre of nitrogen as a nitrate fertilizer in a single application. MONITORING NUTRIENTS AND PESTICIDES IN SUBSURFACE AGRICULTURAL DRAINAGE,
California State Dept. of Water Resources, Fresno. Quality and Treatment Unit.
L. R. Glandon, Jr., and L. A. Beck.
In: Collected Papers Regarding Nitrates in Agricultural Waste Waters, Federal Water Quality Administration Water Pollution Control Research Series 13030 ELY, 12/69, 53-79, December 1969. 27 p, 6 fig, 6 tab, 14 ref. FWQA Project 13030 ELY.

Descriptors: *Leaching, *Nitrates, *Chlorinated hydrocarbon pesticides, *Fertilizers, *Irrigation effects, California, Path of pollutants, Drainage programs, Drainage water, Water pollution sources.
Identifiers: *Central Valley (Calif.), *Groundwater pollution.

The concentrations of nitrogen, phosphorus, and chlorinated hydrocarbon pesticides were measured in agricultural subsurface drainage from tiled areas of the San Joaquin Valley in California. Average concentrations of nitrogen and phosphorus ranged from 2 to 400 mg/liter and 0.01 to 4.0 mg/liter. Large seasonal variations of tile drainage discharge were observed in all areas and were attributed mainly to irrigation. Tile drainage systems in the northern area discharged the greatest amounts of effluent at 1.8 acre-feet per acre per year. Nitrogen concentrations were the highest in combined drainage from the central area; the average annual concentration was 33 mg/liter; seasonal variation ranged from 22 to 51 mg/liter. Recent and older alluvial soils were higher in nitrogen than basin soils. The quantity of nitrogen in tile drainage seldom correlated with the amounts applied. Chlorinated hydrocarbon pesticide concentrations have decreased in tile drainage from all areas investigated for the last 6 years. Pesticide use records from Kern County showed definite decreases in usage of chlorinated hydrocarbons in favor of organic phosphates. Variations in nitrogen concentrations of tile drainage are more dependent upon the physiographic position and soil series than all other factors. High original nitrate contents of soils account for greater quantities of nitrogen in tile drainage than that contributed by fertilizers. (See also W71-04546) (Knapp-USGS)

HYDROGEOCHEMICAL EFFECTS OF INJEC ING WASTES INTO A LIMESTONE AQUIFE NEAR PENSACOLA, FLORIDA,
Geological Survey, Ocala, Fla.
Donald A. Goolsby.
Groundwater, Vol 9, No 1, p 13-19, Januar February 1971. 7 p, 9 fig, 1 tab, 10 ref.

Descriptors: *Path of pollutants, *Water pollutio effects, *Injection wells, *Waste disposal, *Florid Hydrogeology, Geochemistry, Injection, Aquifer Groundwater movement, Aquicludes, Confine water, Monitoring, Observation wells.
Identifiers: *Waste disposal wells, *Florida aquifer, Pensacola (Fla).

Acidic industrial wastes have been injected in deep wells in a limestone aquifer near Pensacol Florida, since 1963. Prior geohydrologic studies i dicated that the limestone aquifer contained no potable water and was overlain by an extensive cla confining layer. Two injection wells are being use to inject the waste at a rate of approximately 2,00 gallons per minute. The injection pressures ar about 200 pounds per square inch. Over 3 billio gallons have been injected. Current study indicate that the waste extends outward about 1 mile fro the injection wells, and pressure effects extend ou ward more than 25 miles. Monitor wells show tha pressure changes are following a predictable pat tern. No wastes have been detected in a monito well open to the Floridan aquifer immediatel above the Bucatunna Clay Member of the Byran Formation and 100 feet from one of the injectio

lls. In a monitor well open to the receiving for-
tion about 1,300 feet south of the injection
lls, effects of the wastes were detected about 10
nths after injection began. In early 1968, the pH
he waste was lowered to about 3. Effects of this
nge were detected at the monitor well about 5
nths later. (Knapp-USGS)

Cost analysis, Cattle, Sheep, Poultry, Hogs,
ck.
iers: *Animal wastes, *Clean water,
ots, Swine, Milk cows, Stream pollution.

prehensive view is provided of the problem
-animal wastes in the United States in rela-
to pollution of water bodies. A framework
lished for estimating costs of animal wastes
to prevent water pollution. In many cases
wastes have proved to be significant pollu-
rces that resulted in fish kills and extensive
to the ecology of the streams. At the
time, however, there is general agreement that not all of the wastes need to be considered as sources of water pollution. Therefore, it would seem that entirely too much emphasis has been placed on the gross possible costs of controlling water pollution from animal wastes. A more realistic base for use in developing programs for water pollution abatement and control from animal wastes is a series of sub-elements that can be independently assessed to determine their pollution potential, applicable control measures, and total pollution control costs. Estimates are presented of the locations, by states, of populations of cattle, milk cows, swine, sheep, and poultry together with discussions of water pollution control practices, wastes discharge frequencies from feedlots, and climate effects. THE ECONOMICS OF CLEAN WATER: INORGANIC CHEMICALS INDUSTRY PROFILE.
Federal Water Pollution Control Administration, Washington, D.C.

For sale by Supt. of Documents, U. S. Govt. Printing Office, Washington, D.C. 20402. Price $3.50. March 1970. Vol 3, 467 p, 64 fig, 65 tab, 86 ref.

Descriptors: *Chemical wastes, *Water pollution sources, *Water pollution treatment, *Waste water treatment, *Pollution abatement, *Inorganic compounds, Chlorine, Fertilizers, Brine disposal, Paints, Inorganic pesticides, Alkalis, Costs.
Identifiers: *Inorganic chemical wastes, Chemical industry wastes, Inorganic wastes.

A description is presented of the inorganic chemical industry, the manpower requirements and costs that the industry would incur in attaining various levels of water pollution abatement over a five year period through 1974. The cost estimates have been based upon published data, general data from contractors on industrial waste treatment methods and costs, and specific data from 59 inorganic chemical plants. The inorganic chemical industry has been defined for purposes of this study as including establishments producing alkalies and chlorine, industrial gases, inorganic pigments, paints and allied products, fertilizers (excluding ammonia and urea), inorganic insecticides and herbicides, explosives, and other major industrial inorganic chemicals. The various production processes, the waste treatment methods practiced, and the possible impact that changes in waste produced are described. Contaminated waste water from the inorganic chemical industry comes primarily from electrolysis and crystallization brines, washings from filter cakes, spent acid and alkalies, and washings from raw materials. MODELING DIURNAL FLUCTUATIONS IN STREAM TEMPERATURE AND DISSOLVED OXYGEN,
Utah Water Research Lab., Logan.
A. D. Kartchner, N. Dixon, and D. W. Hendricks.
Proceedings of the Industrial Waste Conference, 24th, 1969. Purdue University Engineering Extension Series No 135, Part One, p 436-449. 16 fig, 1 tab, 6 ref.

Descriptors: *Water temperature, Dissolved oxygen, Mathematical models, Time series analysis, Temperature.
Identifiers: Little Bear River, Diurnal fluctuation, Fourier Series, Stream temperature.

During the last three years, a project at the Utah Water Research Laboratory has been developing a simulation model for the hydrology and water quality of the Little Bear River, a small mountain valley river system in northern Utah. Two different modeling approaches are inductive empirical mathematical techniques chosen on the basis of their ability to describe the observed data. The two approaches are a Fourier Series curve fitting approach and a time series index approach. The models account for approximately 90 percent of the total variation in the DO data and about 75 percent in temperature data. The time series index model yields a standard deviation for DO of 0.23 mg/l while the Fourier series model gives a value of 0.25 mg/l. The standard deviation for temperature are 0.67C and 0.66C, respectively. To ascertain the character of seasonal changes in these diurnal fluctuation pattern and 22 data blocks representing different times of the year have been analyzed. The modeling curves were obtained by multiplying the mean value by the diurnal indexes determined from the data. (Upadhyaya-Vanderbilt)

VASCULAR AQUATIC PLANTS IN ACID MINE WATER OF THE MONONGAHELA RIVER,WEST VIRGINIA,
West Virginia Univ., Morgantown. Water Research Inst.
Roy B. Clarkson, and Jerry A. Moore.
Available from NTIS as PB-197 526, $3.00 in paper copy, $0.95 in microfiche. 1971. 8 p, 1 tab, 1 fig, 9 ref, Bulletin 2, West Virginia University Bulletin, Series 71, No 7-5. OWRR Project A-005-WVA (3).

Descriptors: *Aquatic plants, *Acid mine water, *Water pollution effects, *Rooted aquatic plants, *Submerged plants, Water pollution, Aquatic weeds, Cattails, Floating plants, Pondweeds, Plants, Aquatic life, West Virginia, Water quality.
Identifiers: *Vascular aquatic plants, Monongahela River basin.

A study of vascular aquatic plants in three West Virginia acid mine water polluted rivers--the Monongahela, Tygart Valley, and West Fork--found plants abundant in many areas. The most common species is Eleocharis acicularis (L.) R. and S. The next most abundant plants are Sagittaria graminea Michx., S. latifolia Willd., Potamogeton epihydrus Raf., P. nodosus Poir., Sparaganium americanum Nutt., and Myriophyllum heterophyllum Michx. Six areas were chosen for intensive study. Water samples from each were analyzed chemically for nitrogen, phosphate, calcium, total acidity, iron and pH. Physical factors studied were the substrate, water velocity, and water-level fluctuation. From a stepwise discriminant analysis, substrate was determined to be the primary physical factor in determining plant distribution. Phosphate

and water-level fluctuation were also significant. Nitrogen, calcium, total acidity, iron, pH, and water velocity were determined to be nonlimiting for the species studied. (Clarkson-West Virginia)

A PRACTICAL APPROACH TO THE ENVIRONMENTAL EFFECTS OF THERMAL DISCHARGES,
Industrial Bio-Test Labs., Northbrook, Ill. Environmental Sciences Div.
Lawrence P. Beer, and Wesley O. Pipes.
Proceedings of the Industrial Waste Conference 24, p 727-744, May 1969. 5 fig, 5 tab, 4 ref.

Descriptors: *Thermal pollution, Temperature, Thermal powerplants, Cooling, Pollution identification, Cooling water, Lake Michigan, Mississippi River, Biological properties, Chemical properties, Fish, Water pollution, Water temperature, Plankton, Benthos, Nuclear powerplants.
Identifiers: Thermal Pollution Surveys.

The technique used in practical surveys on thermal discharges is discussed. The approach consists of: (1) physical measurements, (2) chemical analyses, and (3) biological analyses. This type of survey has been applied to a limited number of locations and those described here are: Lake Michigan, and Mississippi River. Data taken at these sites are summarized. The main conclusions of the paper are: (1) solution to thermal pollution problems will have to be based on evaluation of the particular aquatic environment in question; (2) Field technique of making these evaluations is available and provide a good representation of actual conditions. (3) Continued monitoring of the environment is necessary to determine the relevance of the present water quality standards and to protect industries from unfounded attacks. (Novotny-Vanderbilt)

DISSOLVED OXYGEN AND TEMPERATURE DATA FOR THE WABASH RIVER FROM CLINTON TO HUTSONVILLE - 1967-68,
Weston Paper and Mfg. Co., Terre Haute, Ind.
A. Elmer Guerri.
Proceedings Industrial Waste Conference 24, p 807-849, May 1969. 15 fig, 26 tab.

Descriptors: *Water pollution, *Thermal pollution, *Temperature, *Dissolved oxygen, Waste assimilative capacity, Indiana, Biochemical oxygen demand, Photosynthetic oxygen, Waste disposal, Rivers.
Identifiers: Waste assimilative capacity surveys.

The dissolved oxygen and thermal conditions of the Wabash River in the Terre Haute area have been studied. It was observed that there was a definite relationship between river temperature and dissolved oxygen concentration, and that there was little if any relationship between stream flow and dissolved oxygen. It was found that the temperature increased as the water flowed through the stretch of the river under consideration. The survey data indicated that there was practically no deterioration of the river as it passed through the Terre Haute stretch, due to the addition of organic matter that can be biologically decomposed. (Novotny-Vanderbilt)

EXPERIMENTAL CAGE CULTURE OF CHANNEL CATFISH ICTALURUS PUNCTATUS IN THE HEATED DISCHARGE WATER OF THE MORGAN CREEK STEAM ELECTRIC GENERATING STATION, LAKE COLORADO CITY, TEXAS,
Texas Electric Service Co., Fort Worth.
John E. Tilton, and James F. Kelley.
Second Annaul Workshop, World Mariculture Society, Baton Rouge, Louisiana, February 9, 1970. 14 p, 7 fig, 3 tab, 2 ref.

Descriptors: *Temperature effects, Fish, Heat pollution, *Thermal pollution, Thermal power plants, Lakes, Ponds, Temperature, Fish farming, Water pollution effects, Catfishes, *Channel catfish, Texas.
Identifiers: Ictalurus Punctatus, Lake Colorado (Texas).

Beneficial effects are summarized of heated discharges to the fish population of inland reservoirs in Texas. The sample fish were cultured in a discharge canal for three months. A net increase in weight over 400% in a cage of small test fish in 62 days was observed. In the control pond (with no temperature increase) the fish sample showed no increase in weight. The experiment was performed in January 1970. The control fish were fed but they would consume feed only when several days of warm air temperatures increased pond water temperatures. (Novotny-Vanderbilt)

TRENDS IN THERMAL POLLUTION CONTROL REQUIREMENTS,
Water Pollution Research and Applications, Inc., Washington, D.C.
J. I. Bregman.
Cooling Tower Institute semi-annual meeting, Aspen, Colorado, June 22-24, 1970. 13 p.

Descriptors: *Thermal pollution, Water quality standards, Mixing, Temperature, Temperature effects, Fisheries, Fish populations, Rivers, Streams, Lakes.

There are basically four types of temperature standards in various states. (a) the imposition of the absolute temperature value (maximum temperature), (b) allowable change in the temperature from what it would be without the artificial addition of heat, (c) gradual progression of temperature, (d) mixing some standards. These standards are discussed in regards to fish and fresh water organisms. Some waters exist which are designated to allow no changes from natural conditions. (Waters used as cold water fisheries), in the case of cold water fisheries, most states have established 68F as the maximum allowable temperature and from zero to 5F, with 2F being the usual value, as the maximum allowable increase above background. For warm water fisheries, the maximum allowable temperatures are generally in the range of 83 to 93F and the maximum allowable rise is above 5F. Some special cases of river standards are discussed. THERMAL POLLUTION: A SURVEY OF CAUSE AND EFFECT,
Midwest Research Inst., Kansas City, Mo.
Michael C. Noland.
Midwest Research Institute, Kansas City, Missouri, MRI paper No 918, Presented at the Bi-Annual Meeting of the Cooling Tower Institute, Houston, Texas, January 20-22, 1969. 21 p, 11 ref.

Descriptors: Thermal pollution, Thermal power plants, Temperature, Temperature effects, Rivers, Reservoirs, Cooling water, Heat, Heat balance, Waste water (Pollution).

The discharge of heated water into streams or reservoirs can have a serious effect on the quality of the water with which it is mixed. Approximately 80% of the water used by industry in the USA is used as cooling water. Sources of heated discharges are discussed in the paper. Heated discharges can affect the quality mainly as (1) the influence on the ability of the water to carry and assimilate waste, and (2) the effect on the biodynamic balanc aquatic life forms. Not all effects of the discharges are determined. Possible approache the solution of thermal pollution problems proposed. (Novotny-Vanderbilt)

tifiers: *Cod, Muscle, Liver, Elemental phorus.

ental phosphorus is known to be toxic to man other animals and there are demonstrated in- es of toxicity of colloidal elemental phorus to a freshwater fish species and to a ater animals. Cod rapidly assimilates elemen- hosphorus from sea water into their tissues. In -hour exposure to a concentration of 20-80 phosphorus was concentrated a 1000-fold in iver (even more at lower exposure levels), 10-25 times in white muscle, and about 50- times in red muscle. This distribution is ly in proportion to lipid content and is rm throughout the white muscle of the fillet, facilitating sampling. This remarkably rapid e of elemental phosphorus by cod has been reted as absorption through the gills into the latory system. Even low levels of elemental horus must be considered dangerous in a al environment if fish are exposed for more a few hours. The very efficient concentration mental phosphorus into the liver suggests that sis of depot fat, organs such as liver of fish l provide the most sensitive indication of le exposure to elemental phosphorus in sea- environment. iers: *Hydrosphere, *Biosphere, Food s, Protein sources, Biogenic matter, Food ial.

ndensed survey of the animated segments of rth devotes particular attention to the tive potential of the hydrosphere. Aquatic photosynthesize about 45% of the world's amount of organic matter. The annual tion of oceans varies from 36 to as much as am carbon per square meter. This output is ted with the quotients of utilizable radiation , ranging from 0.02 to 0.33%. The latter um efficiency of the hydrosphere coincides hat of forest stands. The present annual tion of proteins is about 50% short of the supply required to eliminate the obvious and the concealed starvation of the world's population. There is a hope to supplement the future diet by microorganisms, including those of the hydrosphere. Materialization of this possibility depends on the rigid control of factors disrupting the productive efficiency of aquatic ecosystems, such as promiscuous use of pesticides and discharge of untreated domestic or industrial effluents. HAZARDS OF MERCURY.

Special Report of Study Group on Mercury Hazards to Secretary's Pesticide Advisory Committee, Department of Health, Education and Welfare, November 1970. 97 p, 2 fig, 9 tab, 128 ref, 3 append.

Descriptors: *Water pollution effects, *Path of pollutants, *Hazards, *Poisons, *Heavy metals, Water quality, Water pollution sources, Public health, Chemical wastes, Organic compounds, Safety, Monitoring, Human pathology.
Identifiers: *Mercury, *Methylmercury.

The problem of mercury contamination in the United States is potentially grave. The problem has been under intensive study for some years in Sweden and Finland where the patterns of usage of mercury are similar to those in the United States. The present situation stems from the extensive recent increase in the industrial and agricultural uses of mercury. Methylmercury is concentrated several thousand times in fish and shellfish, partly through contamination of their food and partly through its presence in the water. The relative ease with which methylmercury passes the 'blood-brain barrier' accounts for severe neurologic manifestations. The sources of mercury contamination, which caused a recent poisoning disaster in Minamata Bay and Niigata, Japan, were discharges from plants using mercury catalysts in the manufacture of vinyl chloride and acetaldehyde. Methylmercury was preformed in the effluent of these factories. This report is an assessment of hazards of mercury as of mid-1970. It contains many specific recommendations aimed at better understanding and solution of the mercury problem in the United States. (Knapp-USGS)

TEMPERATURE AND WATER-QUALITY CONDITIONS OF THE PATUXENT RIVER ESTUARY, MARYLAND, JANUARY 1966 THROUGH DECEMBER 1967,
Geological Survey, Washington, D.C.
Robert L. Cory, and Jon W. Nauman.
Chesapeake Science, Vol 11, No 4, p 199-209, December 1970. 11 p, 12 fig, 12 ref.

Descriptors: *Remote sensing, *Thermal pollution, *Thermal powerplants, *Estuaries, *Maryland, Water temperature, Heated water, Path of pollutants, Water quality, Water pollution sources, Salinity, Tides, Tidal effects, Water circulation, Streamflow, Mixing.
Identifiers: *Patuxent estuary (Md).

The effect of power plant cooling water in raising natural water temperatures at a location near the power plant on the Patuxent River estuary is clearly evident from thermograph records. Surface temperature at a station 333 m downstream from the discharge canal was raised an average of about 4 C, and at times by as much as 8 C. Temperature rises were greatest during the winter. Infrared imagery showed that elevated surface temperatures could be detected about 5.5 km upstream at flood tide. Temperature profiles obtained from airborne radiation equipment revealed a complicated surface temperature pattern and also showed the effects of density differences and wind action on the steam-electric station effluent plume. Mean annual salinity for a 5-year period (1963-1967) was highest in 1966, about 12.3 parts per thousand, and lowest in 1967, about 9.9 parts per thousand. Dissolved oxygen values for 1966-1967 ranged from 3.2 to 15.6 mg/liter, and saturation ranged from 55 to 152%. Turbidity levels were inversely related to salinity, with the highest annual mean of 28 Jackson Candle Units occurring in 1967, the lowest salinity year. The extreme tide range was 2.1 m; mean water levels at the Patuxent Bridge were highest in summer and lowest in winter. Water stages are more affected by wind speed and direction than by flow in the river. (Knapp-USGS)

EFFECTS OF MINING POLLUTION ON VASCULAR PLANTS IN THE NORTHWEST MIRAMICHI RIVER SYSTEM,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
K. W. Besch, and Patricia Roberts-Pichette.
Canadian Journal of Botany, Vol 48, p 1647-1656, 1970. 5 fig, 3 tab, 15 ref.

Descriptors: *Mining, *Water pollution effects, *Rivers, Copper, Water pollution sources, Submerged plants, Riparian plants, Monocots, Dicots, Toxicity, Invertebrates, Surveys, Flow Hydrogen ion concentration, Grasses.
Identifiers: *Northwest Miramichi (Canada), Zinc, Equisetum arvense, Cyperaceae, Cardamine pensylvanica.

Effects of copper-zinc mining pollution on riparian and aquatic vascular plants were studied in the Northwest Miramichi River system of northern New Brunswick. After a period of 8 years, the riparian vascular flora of the river system's gravel shores has been completely eliminated or seriously reduced. The most sensitive plants are the submersed aquatic species, followed by riparian dicotyledons. Monocotyledons are less sensitive than dicotyledons and Equisetum arvense least susceptible species. A rough index of pollution severity was devised based on the absence of species or species groups which would normally be present under unpolluted conditions. The absence of some spring-flowering geophytes normally

present at the high-water line is believed to be caused by the large amounts of toxic metals accompanying the high spring flows. It is possible to distinguish three different degrees of severity of zinc-copper pollution in rivers and streams, according to the effects on the higher vascular flora. With extremely high pollution, trees and shrubs along the banks are killed; with medium to high pollution only a few species are present, mainly Cyperaceae, Cardamineae, and Equisetaceae; dicotyledons are absent. With low pollution only submerged vascular plants are eliminated. (Jones-Wisconsin)
W71-04619

CHRONIC MALATHION TOXICITY TO THE BLUEFILL (LEPOMIS MACROCHIRUS RAFINESQUE),
Federal Water Quality Administration, Duluth, Minn. National Water Quality Lab.
John G. Eaton.
Water Research, Vol 4, No 10, p 673-684, 1970. 7 tab, 23 ref. FWQA Program 18050 WAE 12/70.

Descriptors: *Pesticide toxicity, *Organophosphorus pesticide, *Bluegills, *Bioassay, Lethal limit, Life history studies, Spawning, Water pollution effects, Toxicity.
Identifiers: *Chronic toxicity, *Malathion toxicity, *Acute toxicity, Malathion, Flowing-water system, Acetylcholinesterase inhibition.

An evaluation is made of the usefulness of an application factor in predicting the chronic toxicity of the pesticide malathion. All life cycle stages of bluegills are exposed to several concentrations of malathion (66 to 0.66 microgram/liter) in a diluter-regulated, flowing water test system in order to identify safe (3.6 microgram/liter) and unsafe (7.4 microgram/liter) levels. The fish spawned in artificial nests while being held in the test chambers. Egg and fry stages were no more sensitive to malathion than older fish. Brain acetylcholinesterase determinations on fish still alive at the end of the chronic test revealed a reduction in activity of nearly 50% among fish exposed to levels considered unsafe, and a depression in activity of one-third the control in toxicant concentrations considered safe. Acute malathion toxicity is also determined for use in calculation of an application factor (chronic toxicity divided by acute toxicity). The resulting application factor for bluegills agrees very closely with one previously calculated for fathead minnows exposed to malathion, even though the long term toxicity of malathion to bluegills is more than 50 times that to fathead minnows.

SANTA BARBARA OIL POLLUTION, 1969, A STUDY OF THE BIOLOGICAL EFFECTS OF THE OIL SPILL WHICH OCCURRED AT SANTA BARBARA, CALIFORNIA, IN 1969,
California, Univ., Santa Barbara.
A. Foster, M. Neushul, A. C. Charters, and R. Zingmark.
Copy available from GPO Sup Doc as I67.13/4:15080 DZR 11/70, $0.55; microfiche from NTIS as PB-197 670, $0.95. Water Pollution Control Research Series 15080 DZR 11/70, October 1970. 49 p, 7 tab, 15 fig, 33 ref. FWPCA Program 15080 DZR.

Descriptors: Water pollution effects, *Water pollution sources, California, *Oily water, Oil wastes, Oil, Littoral, Remote sensing, Aerial photography, *Environmental effects, Intertidal areas, Aquatic habitats, Beaches.
Identifiers: *Santa Barbara (Calif), *Oil spillage, Oil spills, Kelp bed organisms, *Intertidal plants, *Intertidal animals.

The initial flow of oil that began on January 28, 1969, from an offshore oil platform deposited an estimated 4,500 metric tons of pollutant oil on nearly 90 kilometers of coast by February 8, 1969. Winds, wave action, tides, and substrate determined the pattern of the oil distribution in the intertidal zone. Heavy biological damage occurred in intertidal surf grass and barnacle populations as a result of the oil pollution. Based on earlier surveys, the greatest negative biological change at a sample station was the loss of 16 plant species. However, these losses in species were attributable in most cases to sand movement and other storm-associated events. The potential long-term biological effects of the continuing pollution are discussed. This report consists of the introductory material, two short papers, and general discussions. The first paper, The Santa Barbara Oil Spill, I. Initial Quantities and Distribution of Pollutant Crude Oils, deals with the amounts of stranded oil and its distribution. The second paper, The Santa Barbara Oil Spill, II. Initial Effects on Littoral and Kelp Bed Organisms, deals with the preliminary biological effects that we observed. A treatment of aspects of the Santa Barbara pollution problem that relates the authors observations to those of others, and considers the broader implications of marine pollution in general, has been incorporated in the discussion section.

THE EFFECT OF WATER QUALITY AND ENVIRONMENTAL FACTORS ON FRESHWATER FISH,
New Mexico State Univ., University Park. Dept. of Biology.
W. G. Whitford.
Available from NTIS as PB-197 676, $3.00 in paper copy, $0.95 in microfiche. Completion Report, (1970). 6 p, 1 ref. OWRR Project A-003-NMEX (1).

Descriptors: *Water quality, Temperature, Hardness, Acclimatization, Hydrogen Ion Concentration, *Fish, Thermal pollution, *Water temperature.
Identifiers: Green Sunfish, Oxygen content, *Thermal Tolerence.

Water temperatures of Rio Grande River ranged from 0C to 29C, pH ranged from 7.4 to 8.6, total hardness varied from 86 ppm in the upper river to 194 .. 6ppm in the reservoirs. The mean critical thermal maximum (CTM) was 39.9C in fish acclimated in fresh water (10-30ppm), 28.2C in fish acclimated in water at 85 ppm, 27.3C in fish acclimated at 171 ppm. Ion concentration of 180 ppm and 25 ppm has no effect on the CTM of the mosquito, fish, Gambusia affinis. The effect of water hardness on upper lethal temperature of the green sunfish Lepomis cyanellus acclimated at 20C and 30C and hardness levels of 30, 180, and 400 ppm indicated no significant effect of hardness on the incipient lethal temperature 35C for 20C acclimation and 40C for 30C acclimation. The relationship between incipient lethal temperature and acclimation is expressed by the equation, Log (LD50) — 1.322 .. .0056 (CTM in degree C). Incipient lethal of 31C for 10C acclimated fish was obtained. There was no difference in the critical oxygen tension in active fish and nonactive fish. At 20C acclimation the mean oxygen consumption was 0.177 ml/gm/hr. (Upadhyaya-Vanderbilt)

RELATION BETWEEN THE 'ITAI-ITAI EASE AND THE POLLUTION OF R WATER BY CADMIUM FROM A MINE,
Okayoma Univ., Kurashiki (Japan). Ohara In Agricultural Biology.
J. Kobayashi.
5th International Water Pollution Research ference, Pap I-25, San Francisco, California August 1970. 6 fig, 3 tab, 2 ref.

Descriptors: *Heavy metals, *Metals, drainage, *Diseases, *Human pathology, Ino compounds, Water pollution effects, Mine w Mining, Water pollution, Human diseases, health, Epidemiology, Toxicity.
Identifiers: *Cadmium, Cadmium effects, C um pollution, Metals effects.

As a consequence of the discovery of a high tent of Cd, Zn, and Pb in the tissues of the p suffering from the itai-itai disease, which app

a restricted district along the Jintsu River in yama Prefecture, Japan, there was a presumption that the cause of the disease was chronic isoning by the heavy metals found in the waste ter from a mine upstream. The following obser-ions were made: (1) The itai-itai disease and nage to rice by the waste water appeared in the ne place along the banks of the river during the ne period. (2) A heavy accumulation of Cd and er metals was found in the patient's bones, inter- organs, soil, and plants. (3) In animal experi-nts on rats it was proved that the rats fed by Cd reted more Ca than that assimilated from the d while the control group showed the opposite nomena. From these results, it was made clear the itai-itai disease was induced by cadmium in waste water from the mine. (Novotny-Van-bilt)

SOME BIOLOGICAL EFFECTS OF OIL POLLUTION,
Orielton Field Studies Centre. Oil Pollution Research Unit.
Eric B. Cowell.
Your Environment, Vol 1, No 3, p 84, 93-94, Summer 1970.

Descriptors: *Water pollution effects, Oil, *Ecosystems, *Toxicity, *Cleaning, Seepage, Accidents, Detergents.
Identifiers: Limpets, Seaweed control, Population imbalance, *Oil pollution.

Investigating the biological effects of oil pollution and the following shore cleaning operations is complex because the ecosystem is a system of inter-related reactions between the abiotic environment and the organisms that are dependent upon it. It is established that the volatile aromatic compounds in crude oil are the most toxic to wildlife, yet further damage can be done by the detergent/emulsifier beach cleaning methods. If in the process of beach cleaning only one species is killed in sufficient numbers then the ecological chain reaction that follows will ensure wide spread damage to the system and recovery will be slow. These problems with specific examples are presented in detail. (Ensign-PAI)
W71-04802

ANNULMENT AZIRIDINE (APHOLATE) - INDUCED GROWTH INHIBITION IN THE ESTUARINE FLAGELLATE TETRASELMIS SUBCORDIFORMIS BY SOME PURINES AND PYRINIDINES,
Bureau of Sport Fisheries and Wildlife, Highlands, N.J. Sandy Hook Marine Lab.
J. C. Prager, and J. B. Mahoney.
Journal of Protozoology, Vol 16, No 1, p 187-190, 1969. 1 fig, 2 tab, 26 ref.

Descriptors: *Estuaries, *Pesticides, Invertebrates, *Toxicity, Aquatic animals, *Sterilants.
Identifiers: *Marine flagellates, Tetraselmis subcordiformis, *Aziridines.

An insect chemosterilant at 850 ppm apholate reduced growth of the marine flagellate Tetraselmis subcordiformis by 50% in 21 days. Two other aziridinyl chemosterilants tested were more toxic than apholate-values agreeing with those for some estuarine animals. Apholate acted directly on the organisms. Comparatively small molar additions of orotic acid, adenine, guanine and thymine to apholate-poisoned cultures annulled the growth inhibition. Mode of action of aziridinyl chemosterilants by activity annulment is also discussed. (Ensign-PAI)

OYSTERS AND HUMAN VIRUSES: EFFECT OF SEAWATER TURBIDITY ON POLIOVIRUS UPTAKE AND ELIMINATION,
Gulf Coast Water Hygiene Lab., Dauphin Island, Ala.
Frederick E. Hamblet, William F. Hill, Jr., Elmer W. Akin, and William H. Benton.
American Journal of Epidemiology, Vol 89, No 5, p 562-571, May 1969. 2 fig, 6 tab, 28 ref.

Descriptors: *Water pollution effects, *Viruses, *Oysters, *Human diseases, *Turbidity, Water purification.
Identifiers: *Poliovirus, Uptake, Elimination, Crassostrea virginica, Coastal pollution.

The effect of turbidity, in a flow-through seawater system, on Oyster accumulation and elimination of poliovirus was studied. Data indicated that in the virus accumulation stage oysters in low turbidity seawater (16-24 ppm) over a 24 hour period accumulated about three times as much virus (PF U/ml) as those oysters in high turbidity seawater (S4-77 ppm). Turbidity (8-80 ppm) did not significantly influence virus elimination in oysters in the 24 hour period. In 48 hours no virus was found in the oysters. It is concluded that oysters in continuously flowing seawater of either high or low turbidity can eliminate virus in 48 hours in a controlled environment. (Ensign-PAI)

IMPLICATION OF A MARINE AMEBA IN THE DECLINE OF ESCHERICHIA COLI IN SEAWATER,
Harvard Univ., Cambridge, Mass. Div. of Engineering and Applied Physics.
Ralph Mitchell, and Shlomit Yankofsky.
Environmental Science and Technology, Vol 3, No 6, p 574-576, June 1969. 3 fig, 12 ref.

Descriptors: Water pollution effects, *Microorganisms, *Biodegradation, Populations.
Identifiers: *Lysis, *Escherichia coli, *Vexillifera telmathalassa, Marine ameba.

Escherichia coli decline in seawater and the increase of a specific microbial population capable of causing lysis of the intestinal bacteria was observed. Pure cultures of the marine ameba were obtained and the organism was identified as Vexillifera telmathalassa. Adding this marine ameba to natural seawater with E. coli resulted in a rapid kill of the intestinal bacterium. The decline of intestinal bacteria in the sea and the importance of the marine microflora is discussed. (Ensign-PAI)

LEVELS OF STABLE ZN AND 65ZN IN CRASSOSTREA VIRGINICA FROM NORTH CAROLINA,
Bureau of Commercial Fisheries, Beaufort, N.C. Radiobiological Lab.
Douglas A. Wolfe.
Journal of the Canada Fisheries Research Board, Vol 27, No 1, p 47-57, January 1970. 2 fig, 3 tab, 36 ref.

Descriptors: *Radioactive wastes, *Zinc radioisotopes, Shellfish, *Oysters, *Estuaries, North Carolina.
Identifiers: Crassostrea virginica, *Zinc.

An investigation of zinc concentration in oysters in relatively unpolluted estuaries in North Carolina demonstrated high variability. Internal tissues such as the adductor muscle and pericardial sac, had zinc levels less than half those of external tissues. North Carolina oysters contained 2-20pCi 65Zn from fallout per 100g wet weight during the period from 1964-66. From 1965-66 specific activity of 65Zn in these oysters was from 90-300pCi/g Zn, and was declining. (Ensign-PAI)

OIL IN THE ECOSYSTEM,
Robert W. Holcomb.

Science, Vol 166, No 3902, p 204-206, October 10, 1969.

Descriptors: *Oil wastes, *Water pollution effects, *Aquatic life, *Ecology.

Pollution of the marine environment by oil spills is more threatening than ever with the prospect of more oil being transported longer distances in larger tankers. Little is known about the handling of oil spills or the effects of oil on the environment. Birds suffer mortality in high numbers, and entire animal populations have been eradicated from certain areas, but more research is needed. Various programs to study ecology are underway on an international scale in the hopes of finding a solution to the oil problem. (Ensign-PAI)

DISSOLVED FREE AMINO ACIDS IN SEA WATER AND THEIR CONTRIBUTION TO THE NUTRITION OF SEA URCHINS,
California Inst. of Tech., Pasadena. W. M. Keck Lab. of Engineering Materials.
Mary E. Clark.
California Institute of Technology, Pasadena, W. M. Keck Laboratory of Environmental Health Engineering. Annual Report, Chapter 6, p 70-93, July 1968 - June 1969. 2 fig, 7 tab, 48 ref.

Descriptors: *Sewage, *Outlets, *Nutrients, *Amino acids, *Marine animals.
Identifiers: *Sea Urchins, Glycine, Serine, Alanine, Aspartic acid.

A study of the dissolved free amino acids in sea water from the Los Angeles Basin and uptake rates of the four major amino acids by a local species of urchins Strongylocentrotus purpurats is presented. The method of DFAA Analysis, actual DFAA concentrations found, and the contribution which glycine, serine, alanine and aspartic acid make to the nutrition of the urchins is described. Approximately 50% of the daily nutrient requirements for urchins living near sewage outfalls can be fulfilled by uptake of the DFAA. (Ensign-PAI)

STRONTIUM-90 AND CESIUM-137 LEVELS IN TISSUES OF FIN WHALE (BALAENOPTERA PHYSALUS) AND HARP SEAL (PAGOPHILUS GROENLANDICUS),
Department of National Health and Welfare, Ottawa (Ontario). Radiation Protection Div.
E. R. Samuels, M. Cawthorn, B. H. Lauer, and B. E. Baker.
Canadian Journal of Zoology, Vol 48, No 2, p 267-269, March 1970. 1 tab, 10 ref.

Descriptors: *Mammals, *Radioisotopes, *Strontium radioisotopes, *Cesium, Water pollution effects.
Identifiers: *Whales, *Seals.

Strontium-90 and Cesium-137, in eleven different tissues of the fin whale and two tissues of the harp seal were identified. The highest concentration of strontium-90 was found in whale blubber. Muscle tissue seemed to contain more Cesium-137 than did the other tissues. The average concentration of Cesium-137 in whale muscle was 4.5 Ci/g ash and in adult seal muscle was 2.5 pCi/g ash. SALMONELLA TYPES ISOLATED FROM THE GULF OF AARHUS COMPARED WITH TYPES FROM INFECTED HUMAN BEINGS, ANIMALS, AND FEED PRODUCTS IN DENMARK,
Aarhus Univ. (Denmark). Inst. of Hygiene.
K. Grunnet, and B. Brest Nielsen.
Applied Microbiology, Vol 18, No 6, p 985-990, December 1969. 3 fig, 4 tab, 16 ref.

Descriptors: *Waste water disposal, Pollutants, *Bacteria, Food chains.
Identifiers: *Salmonella, Gulf of Aarhus, Denmark.

The Gulf of Aarhus, which receives waste water from industries and from 100,000 inhabitants was investigated for Salmonella over a two year period. Distribution of Salmonella types in the Gulf of Aarhus and in Oeresound, from 1966 to 1968 and the distribution in man, animals, and foodstuffs during the time from 1960 to 1968 in Denmark as a whole are shown. The classical chain of infection feedstuffs-animals-food-man is not indicated in Denmark. Though there are a great many human cases, the examined types of Salmonella were not found in animals or foodstuffs during this period. Qualitative Salmonella examinations to supplement the E. coli counts when examining polluted waters is suggested. (Ensign-PAI)

THERMAL REQUIREMENTS TO PROTECT AQUATIC LIFE,
National Marine Water Quality Lab., West Kingston, R.I.
Clarence M. Tarzwell.
Abstracts in German, Portuguese and Spanish. Journal Water Pollution Control Federation, Vol 42, No 5, p 824-828, May 1970.

Descriptors: Water quality control, *Temperature control, *Oxygen requirements, *Aquatic life, Animal metabolism, Seasonal, Temperature, *Thermal pollution.
Identifiers: Temperature effects, Population imbalance, Spawning, Nest-building fish.

Temperature and oxygen must be considered in determining water quality requirements because aquatic organisms are cold-blooded and their metabolism is dependent on the temperature of the water. Through long periods of development these organisms adjusted to certain temperatures and daily and seasonal fluctuations in temperature. In setting temperature criteria, it is desirable to have a nationwide standard, and to maintain these fluctuations. The National Technical Advisory Committee of Water Quality Requirements for Aquatic Life indicated uniform allowable increase above the monthly average of the daily maximum temperatures. These increases are influenced by season, the most sensitive species and life stages in the biota, and the main taxonomic groups present. Temperature control is important to the abatement and control of pollution as well as conserving our aquatic life resources. (Ensign-PAI)

WHAT OIL DOES TO ECOLOGY,
California Inst. of Tech., Pasadena. W. M. Keck Lab. of Engineering Materials.
Charles T. Mitchell, Einar K. Anderson, Lawrence G. Jones, and Wheeler J. North.
Abstracts in French, German and Spanish. Journal Water Pollution Control Federation, Vol 42, No 5, p 812-818, May 1970. 8 fig, 7 ref.

Descriptors: Water pollution effects, Oil, *Seepage, *Ecosystems, *Toxicity, Animal populations, Plant populations, Ecology.
Identifiers: Tampico spillage, Santa Barbara spillage, Community changes, Population imbalance, Kelp, *Oil pollution.

Criteria for evaluating ecological consequences are presented and the observations of two spillages are explained in terms of the biological effects of exposure to oil. The Tampico spillage of diesel fuel in a cove on the Coast of Mexico in 1957 produced definable changes for approximately 5 miles. The Santa Barbara spillage of crude oil affected certain bird species but did not cause significant mortalities among intertidal and shallow subtidal organisms. These two accidents indicate that the ecological reactions to oil spillage vary with the character of the pollutant, the oceanographic conditions and the extent of the success of cleanup operations. NG TOWERS Q AND A.
n Inst. of Chemical Engineers, New York.
ommittee.

l Water Engineering, Vol 7, No 11, p 19-
1970.

ors: *Cooling towers, *Water cooling, Ion
e, Thermal pollution, Waste water treat-

rs: *Polyphosphates, *Chromate recovery,

Three main topics are considered: blowdown and make up, air cooling, and corrosion control in the tower. Due to its simplicity, continuous blowdown through an overflow in the cooling tower cold-water basin is usually employed. A change in the basin water level, controlled by the makeup water-float value, regulates the amount of blowdown. The oil and scum floating on the surface of the water is continuously removed from the system, but no provisions are made for sludge removal. It is said that 70-80% of excess plant heat in new petroleum refineries, petrochemical and natural gas processing plants is removed at a level favorable for air cooling. Ion exchange can be used for zinc-chromate blowdowns as well as for blowdowns free of zinc. (Herrera-Vanderbilt)

COOLING TOWERS, THE ENVIRONMENT AND THE FUTURE,
IIT Research Inst., Chicago, Ill.
Eric Aynsley.
Cooling Tower Institute Meeting, Snowmass-at-Aspen, Colorado, June 22-25, 1970. 12 p, 5 fig, 3 ref.

Descriptors: Cooling towers, Cooling, Thermal pollution, Air-pollution effects, Atmosphere pollution, Pollutants, Evaporation, Heat, Heat pollution.

The paper deals with the use of natural draft cooling towers for cooling of process water and their effects on the environment. The use of the draft cooling towers has increased exponentially since 1962 when the first one was put into operation. IIT Research Institute has completed a study of tower emissions and possible related environmental effects. Hyperbolic tower have much larger point emissions of heat and water vapor and have the potential to form dense, extensive fogs. Mixing of the tower and stack plumes was confirmed. There are a number of effects, mechanisms and interactions occurring both with cooling tower plumes and tower plumes mixed with nearby stack emissions. Some problems concerned with the salt emission from cooling systems using sea water for cooling are pointed out. (Novotny-Vanderbilt)

COOLING TOWER APPLICATION,
Kohloss (Frederick H.) and Associates Inc., Honolulu, Hawaii.
Frederick H. Kohloss.
American Society of Heating, Refrigerating and Air-Conditioning Engineers Journal, p 49-52, Aug 1970. 3 fig, 1 tab.

Descriptors: Cooling towers, Air conditioning, Structures, Water treatment, Performance, Water cooling, Waste water treatment.
Identifiers: Blow-through, Capacity, Air flow.

Cooling towers permit recirculation and reuse of water which has picked up heat, in a refrigeration condenser or other device, by having atmospheric air contact the water, and by evaporating a little of water to cool the rest of it. Among the types of smaller cooling towers available, the application engineers choice is dictated by performance, weight, height, power consumption, noise, building code requirements, fire code requirements, and most of all capital cost. If a tower is not level, performance will probably suffer from uneven distribution of water through the fill. Structurally adequate may be too limber to avoid vibration transmission. This can be overcome by soft-spring mounts with large deflections. Blow-through tower design is extremely susceptible to non-uniform airflow. Chemical analysis of water should be known in order to preplan the bleed rate. Usually on larger systems, water treatment for control of pH, a corrosion inhibitor, scale control, and biocides are all employed. Restriction of airflow at the cooling tower inlet and discharge are the major cause of reduced tower capacity. Many published applications recommendations suggest a design wet bulb temperature equaled or exceeded for 5% of the hours of the few hottest months of the year. (Upadhyaya-Vanderbilt)

MICROPROBE TECHNIQUES FOR DETERMINING DIFFUSIVITIES AND RESPIRATION RATES IN MICROBIAL SLIME SYSTEMS,
Clemson Univ., S.C. Dept. of Environmental Systems Engineering.
H. R. Bungay, W. J. Whalen, and W. M. Sanders.
Biotechnology and Bioengineering, Vol XI, No 5, p 765-772, May 1969. 2 fig, 2 tab, 5 ref.

Descriptors: *Slime, *Mass Transfer, *Diffusivity, Diffusion, Boundary processes, Dissolved oxygen, Microorganisms, Bacteria, Waste water treatment, Biological treatment.
Identifiers: Microbial slime films, *Microprobe, Steady state, Transient, Oxygen electrode, Gradient, Differentiation.

Microbial slime films are used in a variety of processes. They have been adapted directly from the natural environment for use in trickling filters. The critical factor controlling employment of these thin films is the mass transfer to and within them. In this instance, oxygen concentration near the surface and within a biological film was monitored using a microprobe oxygen electrode. With dilute medium, oxygen consumption was stable, indicating substrate limitation. With concentrated media, oxygen concentratior dropped indicating that oxygen supply was limited. Results indicated that substrate could be stored under conditions of high concentration, and then utilized later. This was not possible for oxygen because of its relatively low solubility. (Lowry-Texas)

THE ISOLATION OF VIRUSES FROM SEWAGE AND TREATED SEWAGE EFFLUENTS,
National Institute for Water Research, Pretoria (South Africa).
E. M. Nupen.
Water Pollution Control, Vol 69, No 4, p 430-455, 1970. 1 table, 31 ref.

Descriptors: *Vriuses, *Epidemiology, *Public health, Microbiology, Microorganisms, Diseases, Flocculation, Filtration, Chlorination, Water purification, E. Coli, Disinfection, Waste water treatment.
Identifiers: Roll tube assay method, Plaque Assay.

There are a great number of viruses in sewage and yet few virus epidemnics have been attributed to drinking water although current epidemiological methods may not be sensitive enough to detect viral transport via water. Some water purification processes reduce the number of eneric viruses in sewage and although physical and chemical procedures such as flocculation, sand filitration, and chlorination result in further removal or inactivation, no system so far developed entirely eliminates these viral particles. The current methods for viral quantification are limited and new techniques have been developed or are under investigation. Different viruses react in a different manner than E. Coli to most disinfection procedures so E. Coli cannot be used as a contamination indicator. (Ellis-Texas)

COLLECTION AND DISPOSAL OF FARM WASTES,
Ministry of Agriculture (Northern Ireland).
J. S. V. McAllister.
Water Pollution Control, Vol 69, No 4, p 425-429, 1970. 6 tab, 5 ref.

Descriptors: *Farm wastes, *Slurries, Sewage, Aeration, Incineration, Biochemical oxygen demand, Farm lagoons, Water pollution, Nitrogen, Ammonia, Methane, Hydrogen sulphide, Phosphorous, Waste water disposal, Waste water treatment.

Identifiers: *Pig slurries, *Poultry droppings, *Cattle excreta, Silage.

Improved farming techniques, suburban development, and a wider realization of the necessity to control pollution of the atmosphere and water supplies have increased the problem of farm waste collection and disposal. Generally, in Europe farm wastes are collected in the form of a slurry but disposing of this slurry is a problem. The use of this slurry as a manure has certain drawbacks and alternative methods of disposal such as drying, incineration, aeration treatment, or synthesis of feeding stuffs are explored. (Ellis-Texas)

TANNERY PRE-TREATMENT PLANT DRASTICALLY CUTS BARRE'S TREATMENT PLANT LOAD.

Water and Pollution Control, April 1970, p 61-62. 1 fig.

Descriptors: *Waste water treatment, *Industrial wastes, Hydrogen ion concentration, Biochemical oxygen demand, Cost, Sedimentation, Sludge, Slime, Organic wastes.
Identifiers: *Tannery wastes, Suspended solids, Ether solubles, Barrie (Ontario, Canada).

Gore and Storrie Limited of Toronto, Canada was retained to design and supervise construction of a pre-treatment plant for tannery wastes. Prior to design sedimentation tests, sludge studies, the effect of polyelectrolytes, and water use reduction were scrutinized to determine how they affected treatment. The plant was designed and built by 1968 at a total cost of $195,000 and consisted of facilities to provide for screening, flow equilization, pre-aeration, settling, sludge removal and storage, scum removal, flow metering, tank truck removal of scum and sludge, and unwatering. This pretreatment significantly reduced the sludge volume in the city's treatment plant. (Ellis-Texas)

SALMONELLA-ITS PRESENCE IN AND REMOVAL FROM A WASTE WATER SYSTEM,
Rijksinstituut voor de Volksgezondheid, Utrecht (Netherlands).
E. H. Kampelmacher, and L. M. van Noorle Jansen.
Journal Water Pollution Control Federation, Vol 42, No 12, p 2069-2073, December 1970. 1 fig, 3 tab, 15 ref.

Descriptors: *Salmonella, *Cultures, Enteric bacteria, Microorganism, Pathogenic bacteria, Waste water treatment, Sewage treatment, Trickling filters, Sedimentation, Retention, Gamma rays, Tracers.
Identifiers: *Salmonellosis, Gamma scintillation counter, Radioactive nuclide, Most probable number (MPN).

A study was made to determine the degree of contamination by Salmonella of waste water by qualitative and quantitative methods in a waste treatment plant in a Dutch town of over 100,000 people. An attempt was also made to establish whether salmonella is eliminated by the trickling filter process. When 3 x 10 in S. utrecht germs were added to the influent, an average of 60 germs/100 ml effluent were recovered in 10.5 hours while normal operation shows 100 germs/100 ml of Salmonella germs. It can be maintained that 10 upper 10 salmonella germs enter the plant each hour while 10 upper 9 salmonella germs are released with the effluent each hour. The reduction in the concentration of salmonella is quite small and disinfection of the effluent merits consideration. (Ellis-Texas)

TREATMENT OF WINE DISTILLING WASTES BY ANAEROBIC DIGESTION,
Council for Scientific and Industrial Research, Pretoria (South Africa).
G. J. Stander.
Proceedings 22nd Industrial Waste Conference, May 2, 3, 4, 1967, Purdue University, Vol L II, no 3, p 892-907, July 1968. 8 fig, 4 tab, 6 ref.

Descriptors: *Anaerobic digestion, Domestic wastes, Sewage treatment, Waste water treatment, Stabilization, Biochemical oxygen demand, Chemical oxygen demand, Phosphates, Nitrogen, Costs.
Identifiers: *Wine distillery wastes, Spent wine, Ethyl alcohol, South Africa, Dorr-Oliver Clarigester.

A program of operational research with a full-scale treatment plant located in the main wine producing area of South Africa has been undertaken by the Cape Regional Laboratory of the National Institute for Water Research (NIWR). Laboratory and pilot scale studies have been conducted from 1948 to date and have indicated that anaerobic digestion might provide a practical method for dealing with wine wastes. The full-scale treatment plant consists of a modified 'Dorr-Oliver Clarigester' and the description and operation of this plant is discussed. Many unknown factors which existed in regard to the biological, metabolic pathways, technological, and physical aspects of the practical operation of an anaerobic digestor are included. The effluent from the anaerobic digestion of spent wine still contains approximately 1.8% of its original COD which amounts to about 400 mg/l and this needs additional stabilization which can be accomplished in conventional sewage treatment. The cost type of treatment is approximately 56 ce 1000 gallons. (Ellis-Texas)

BIODEGRADATION OF LAS BENZENE R IN ACTIVATED SLUDGE,
Monsanto Co., St. Louis, Mo.
R. D. Swisher.

eedings, 22nd Industrial Waste Conference, 2, 3, 4, 1967, Purdue University, Vol LII, No 375-392, July 1968. 7 fig, 3 tab, 18 ref.

riptors: *Biodegradation, *Activated sludge, age treatment, Biological treatment, Water ication, Surfactants, Detergents, Sulfonates, ar alkyl sulfonates, Colorimetry, Spec- otometry, Waste water treatment.
ifiers: *LAS Benzene rings, Warburg rometry.

st complete removal of the benzene rings of can be accomplished by activated sludge a variety of conditions. An experiment was cted to study the ring degradation of 3-phen- 6-phenyldodecane. A small residual UV ad- on corresponding to a few percent of the ini- ngs were encountered and may have been d by: (1) insufficient time for complete dation; (2) the possibility that the residual ial originates in small amounts of impurities t in the samples; (3) and the possibility that odegradation pathways are involved, a major ading to complete destruction, and a minor rminating in a dead end somewhere short of ete degradation. However, this effect is of consequence, since ring degradation eds to the extent of 85-90% or more with isomer. Continuous and semi-continuous ent tests were conducted and led to the con- that a 24 hour semi-continuous feed is not a vigorous biodegradation system than a con- s flow with a shorter residence time. In- tions have shown that effluents from the radation of LAS are non-toxic at LAS levels mg/l or more which is much higher than n the field. (Ellis-Texas)

ARGEST OXIDATION DITCH IN THE FOR THE TREATMENT OF INDUS- VASTES,
dse Staatsmijnen N. V., Geleen.
a.
ngs, 22nd Industrial Waste Conference, , 4, 1967, Purdue University, Vol LII, No 730, July 1968. 15 fig, 4 tab.

rs: *Oxidation, *Activated sludge, tion, Industrial wastes, Biochemical ox- and, Chemical oxygen demand, Nitrogen, Nitrification, Ammonia, Denitrification, Phosphorous, Hydrogen ion concentration, Cost analysis, Waste water treatment, Biological treatment.
Identifiers: *Oxidation ditch, Pasveer ditch, Netherlands.

An investigation was made of the biological treatment of waste water coming from two coking plants, a plant whose effluent contained chemicals used in the preparation of polyethylene and formaldehyde, and a third type of plant which discharged large amounts of organic wastes. A comparison of the activated sludge process versus the oxidation was made and the latter process was deemed to be more appropriate for treatment of this particular waste. The biological purification under nitrification and denitrification conditions, the trouble caused by a shortage of phosphorous, maximum capacity of the ditch and plans to enlarge the capacity, capital and operating costs, and other data on the Pasveer Ditch are discussed. NITRO-CELLULOSE INDUSTRIAL WASTE,
Technische Hochschule, Hanover (West Germany). Inst. of Sanitary Engineering.
Klaus Mudrack.
Proceedings, 21st Industrial Waste Conference, May 3, 4, 5, 1966, Purdue University, Vol L, No 2, p 656-664. 7 fig, 12 ref.

Descriptors: *Cellulose, *Acidity, *Alkalinity, *Neutralization, Corrosion, Denitrification, Hardness (Water), Sulfates, Microorganism, Metabolism, Centrifugation, Purification, Activated sludge, *Chemical wastes, Waste water treatment, Industrial wastes, Sulfur.
Identifiers: Nitro-cellulose, Gun-cotton, Collodion, Nitric acid, Sulfuric acid.

Nitro-cellulose wastes contain nitric acid, sulfuric acid and various other chemicals, including an extremely high content of sulfur. Neutralization is imperative whether the waste is treated biologically or discharged to a dilutant stream. Further addition of phosphorous in the amount of .2 mg/l is necessary to support biological treatment. The high nitrate content of nitro-cellulose waste allows it to be treated in a biological denitrifying process rather than conventional activated sludge. The advantages of the denitrification process are: (1) treatment is achieved with no artifical oxygen supply; (2) the nitrate content of the sewage is reduced; (3) the pH value of the sewage increases during treatment; (4) less excess sludge is produced. Close control must be maintained over the process since the high nitrate content gives the sludge a tendency to float. Care must also be taken in the design of the plant, since even the neutralized waste streams are sufficiently high in sulfates to cause corrosion difficulties, particularly in concrete pipes. (Lowry-Texas)

TREATMENT OF PHOTOGRAPHIC LABORATORY WASTES AT NORTON AIR FORCE BASE, CALIFORNIA,
Montgomery Research, Inc., Pasadena, Calif.
Paul V. Hennessy, Donald G. Rosenberg, and Raymond G. Zehnpfenning.
Proceedings, 22nd Industrial Waste Conference, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, p 740-751, July 1968. 1 fig, 7 tab.

Descriptors: *Industrial wastes, *Groundwater, Activated sludge, Trickling filters, Sewage treatment, Geology, Conductivity, Hydrogen ion concentration, California, Waste water treatment, Biological treatment.
Identifiers: *Cyanide, *Ferrocyanide, *Ferricyanide, Norton Air Force Base (Calif), San Bernardino (Calif), *Photographic wastes.

Norton Air Force Base disposes of sanitary and industrial wastes through the facilities of the City of San Bernardino which uses secondary biological processes in the treatment of its wastes. The geological setting of this area is such that the waste water that leaves this area is used again by municipalities and agriculture, therefore, it is essential that minerals and toxic materials must be adequately treated or disposed of to prevent a buildup of these elements. Methods of disposal, regulation of discharge, the monitoring program, the nature of the waste streams, and the treatment of cyanide are discussed in relation to Norton Air Force Base. (Ellis-Texas)

FLYASH AS A FILTERING AID FOR DEWATERING INDUSTRIAL WASTE SLUDGE,
Uniroyal, Inc., Mishawaka, Ind.
F. W. Moehle.
Proceedings, 22nd Industrial Waste Conference, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, p 429-440, July 1968. 7 fig.

Descriptors: *Dewatering, *Fly ash, *Filtration, *Sludge, *Industrial wastes, Sludge treatment, Sludge disposal, Hydrogen ion concentration, Chutes, Conveyance, Structures, Temperature, Waste water treatment, Indiana.
Identifiers: Sludge concentration, Vacuum filter, Filter drums, Compressed air.

Dewatering industrial waste plant sludge using flyash has proven successful at Uniroyal, Inc., U. S. Rubber plant located at Mishawaka, Indiana. In the process of dewatering the sludge, six major pieces of equipment are involved: (1) a filter drum that works on vacuum filtration; (2) a screw type conveyor to mix the sludge-flyash mixture and transport it to the filter drum; (3) a centrifuged blower is used to maintain the desired vacuum in the filter drum vacuum chambers; (4) filtrate pump; (5) a blower type air compressor that supplies air to the vacuum filter for filter cake removal; and (6) a cake collecting chute and conveyor. Field and lab studies considered: (1) the proper concentrations of flyash; (2) the effect of sludge temperature on the dewatering process; (3) the effect of pH of the sludge; (4) the effect of sludge solids concentration; and (5) the effect of various vacuum conditions for proper sludge dewatering. HYDRAULIC AND PROCESS ASPECTS OF REACTOR DESIGN-I, BASIC CONCEPTS IN STEADY-STATE ANALYSIS,
Rice Univ., Houston, Tex.
J. C. McLellan, and A. W. Busch.
Proceedings, 22nd Industrial Waste Conference, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, p 537-552, July 1968. 8 fig, 3 tab, 15 ref.

Descriptors: *Hydraulics, *Activated sludge, *Design, Biochemical oxygen demand, Organic wastes, Retention, Aeration, Waste water treatment.
Identifiers: *Steady-state analysis, Substrate utilization, Mixed liquor, Suspended solids.

A method by which the poundage of microorganisms required to remove a total poundage of soluble organic waste in a given period of time and produce an effluent of a given substrate concentration is presented. The interaction of the flow rate and influent substrate concentration affects effluent quality in the activated sludge process. The effects of either of these factors may be negated by control of the MLSS poundage in the aerator up to the limiting MLSS concentration. One of the critical points in choosing an aerator volume is the ability to control the MLSS concentration. Once the reactor volume has been chosen, the MLSS concentration governs effluent quality. Hydraulic retention time is not a fundamental criterion of activated sludge process design because the apparent need for increased hydraulic detention time may be offset by increases in MLSS poundage. Subsequent papers in this series will extend the analysis to unsteady-state conditions. (Ellis-Texas)
W71-04503

LIMITATIONS OF OXYGEN TRANSFER IN THE WARBURG APPARATUS,
Rice Univ., Houston, Tex.
J. O. Bryant, W. W. Akers, and A. W. Busch.
Proceedings, 22nd Industrial Waste Conference, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, p 686-698, July 1968. 6 fig, 2 tab, 29 ref.

Descriptors: *Mass transfer, *Respiration, *Oxygen, Pressure, Biochemistry, Waste water treatment, Degradation, Oxidation, Oxygen demand.
Identifiers: *Warburg apparatus, *Oxygen transfer, Glutamic acid, Glucose, Oxygen uptake.

In order to show that oxygen transfer rates can limit the rate of biological reactions in the Warburg system, experiments were conducted to determine oxygen uptake progressions for the degradation of glutamic acid, glucose, sodium acetate, and pyruvic acid by mixed microbial populations at oxygen partial pressures of 0.21, 0.50, and 1.0 atmospheres in the Warburg respirometer. The limiting mechanism in oxygen uptake progressions obtained under these experimental conditions for plateau oxygen demands greater than 100 mg/l is the physical transfer of oxygen from the gas to the liquid phase. Oxygen limitation in the system may affect the study of biological oxidation by distorting apparent reaction stoichiometry and by yielding erroneous rate measurements. (Ellis-Texas)

CANNERY WASTE TREATMENT PART II. TREATABILITY,
San Jose State Coll., Calif.
F. J. Agardy, R. G. Spicher, and G. T. Orlob.
Proceedings, 22nd Industrial Waste Conference, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, p 699-705, July 1968. 1 fig, 2 tab.

Descriptors: *Waste treatment, *Canneries, Organic matter, *Biodegradation, *Organic wastes, Biochemical oxygen demand, Chemical oxygen demand, Toxicity, Waste water treatment.
Identifiers: Peach waste, Tomato waste, Carbonaceous, Biodegradation rate.

An analysis of dissolved versus suspended solids, volatile and inert SS, volatile and inert DS, volatile and inert TS, the disposition of BOD and COD, and biodegradation rate studies were conducted. The cannery waste of tomatoes and peaches were found to have a high percentage of organic matter in solution. This distribution of organic matter favors the employment of biochemical treatment methods suitable for stabilization of dissolved organics as opposed to physical processes. There is a possibility that high concentrations of cannery wastes might result in a reduction of biodegradation rate due to a lack of required nutrients or presence of trace inhibitory agents. (Ellis-Texas)

AQUA AMMONIA NEUTRALIZATION OF ACID EFFLUENT FROM A DEIONIZER,
Carling Breweries Ltd., Waterloo (Ontario).
W. R. Garvie, and D. E. Waite.
Proceedings, 21st Industrial Waste Conference, May 3, 4, 5, 1966, Purdue University, Vol L, No 2, p 650-655. 3 fig, 1 tab.

Descriptors: *Hydrogen ion concentration, *Neutralization, *Alkalinity, *Acidity, Nitrogen compounds, Mixing, Solubility, Ion exchange, Biocehmical oxygen demand, Automatic control, Chemical wastes, Waste water treatment, Ammonia compounds, Effluents.
Identifiers: *Caustic soda, *Aqua ammonia, Regeneration, Resin exhaustion, Deionizer.

Overall benefits of aqua ammonia are: (1) Reduced chemical costs based on equivalent weights; (2) Reduced chemical costs based on more efficient neutralization; (3) Improved automatic control yielding a more uniform effluent to the sewers; (4) Reduced suspended solids in the effluent as a result of increased solubility of ammonia salts; (5) Provision of a prime source of available nitrogen to the activated sludge process of the sewage treatment plant. Problems associated with the use of ammonia nitrogen are primarily associated with fumes, corrosive effects, and danger of explosion. Proper ventilation, inspection, and maintenance are imperative. If properly designed and maintained, ammonia nitrogen neutralizing equipment can successfully alleviate most acid waste problems with good economic competitiveness. (Lowry-Texas)
W71-04506

DECONTAMINATION OF CYANIDE WASTES BY METHODS OF CATALYTIC OXIDATION AND ADSORPTION,
Ruhr River Association, Essen (West Germany).
Wilhelm Bucksteeg.
Proceedings, 21st Industrial Waste Conference, May 3, 4, 5, 1966, Purdue University, Vol L, No 2, p 688-695. 1 fig, 5 tab, 3 ref.

Descriptors: *Chemical wastes, *Adsorption, *Oxidation, *Catalyst, Sedimentation, Trickling filters, Biodegradation, Biological treatment, Waste water treatment.
Identifiers: *Cyanide wastes, *Low temperature coke, *Sewage sludge charcoal, Galvanic wastes, Toxic shock, Ceramic.

Low temperature coke made from soft brown coal shows surprising ability to adsorb and oxidize potassium cyanide and free cyanide. The cyanide is adsorbed onto the surfaces of the coke grains and part of it is oxidized to CO2, nitrogen, and water, while the rest is decomposed to carbon dioxide and ammonia. Experiments with low temperature coke and sewage sludge charcoal showed removals of cyanide in the 90 to 99% range. Filters made with low temperature coke have two distinct advantages to users. Manufacturers can often recycle water from which cyanides have been removed. This means considerable savings to manufacturing concerns. Also, waste water filtered to remove cyanides can then be treated biologically, and by incorporating an upper layer of coke and ceramic material with a conventional filler in a lower layer, then cyanide removal and biological treatment can be achieved in the same facility at great savings. (Lowry-Texas)
W71-04507

THE TREATMENT OF FLUORIDE WASTES,
Corning Glass Works, N.Y.
W. Zabban, and H. W. Jewett.
Proceedings, 22nd Industrial Waste Conference, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, p 706-716, July 1968. 8 fig, 7 ref.

Descriptors: *Waste water treatment, Sedimentation, Chemical precipitation, *Neutralization, Toxicity, Industrial wastes, Hydrogen ion concentration, Temperature, Ion exchange.
Identifiers: *Fluoride wastes, *Activated alumina, Sodium hydroxide, Bone char, Hydrofluoric acid waste, Calcium hydroxide.

Hydrofluoric acid wastes mixed with abrasive and siliceous wastes have been treated satisfactorily at a number of plants by neutralization with calcium hydroxide and sedimentation in continuous clarification units at pH values of slightly over 11. Clarified effluents containing less than 20 mg/l of fluoride ion are produced. If the treated effluent is allowed to stand for several hours, post precipitation of fluoride salt will occur, thus increasing the concentration of fluoride in the effluent to within the solubility limits for calcium fluoride. Where required, additional fluoride removal may be obtained by passage of the fluoride waste through a bed of activated alumina regenerated with sulfuric acid, or through bone char regenerated with sodium hydroxide. UPTAKE OF SOLUBLE PHOSPHATE BY ACTIVATED SLUDGE: PARAMETERS OF INFLUENCE,
Maine Univ., Orono.
Millard W. Hall, and Richard Engelbrecht.
7th Industrial Water and Waste Conference, Texas Water Pollution Control Association, June 1 and 2, 1967, p II-8-II-27. 7 fig, 4 tab, 14 ref. United States Public Health Service Research Fellowship No 5-F1-WP21,616-03.

Descriptors: *Phosphate, *Activated sludge, *Dissolved oxygen, *Aeration, Hydrogen ion concentration, Chemical oxygen demand, Waste water treatment.
Identifiers: *Mixed liquor, Suspended solids, *Substrate.

An assessment by laboratory experimentation of the influence of mixed liquor suspended solids concentration, substrate concentrations and dissolved oxygen concentration on the magnitude and rate of soluble phosphate reduction in activated sludge mixed liquor. Aeration on time was found to be an important parameter inasmuch as 90% reduction of the phosphate content was achieved in a 24 hour period but 50% of this was achieved in the first 6 hours. The MLSS concentration in the range employed by most activated sludge plants was not a significant factor in phosphate removal. Soluble phosphate uptake increased with increasing initial soluble substrate concentration. Soluble phosphate reduction is also dependent upon the DO concentration. (Ellis-Texas)

ON PURIFICATION OF RADIOACTIVE WASTE WATER BY CONTACT PRECIPITATION. 4TH COMMUNICATION: EFFECT OF COMPLEX FORMERS, DETERGENTS, AND WASH LIQUIDS, (IN GERMAN),
Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (East Germany).
G. Sachse, and H. Schlenkrich.
Kernenergie, Vol 12, No 11, p 363-367, 1969. 3 fig, 5 tab, 8 ref.

Descriptors: *Waste water treatments, *Radioactive wastes, Detergents, Precipitable water, Separation techniques, Waste disposal, Nuclear powerplants, Calcium carbonate, Water purification.
Identifiers: Cerium-141, Strontium-90, Condensed phosphates, Dresden (Germany).

This part of the investigations of waste water was concerned with the effect of complex formers and detergents on contact precipitation and behavior of cerium-141 and strontium-90. It was demonstrated that oxalic, citric, and tartaric acids in concentrations between 100 and 150 mg/l, as well as the detergents and wash liquids up to concentrations from 75 to 100 mg/l, exert no detrimental influence on calcium carbonate precipitation. On the other hand, strong complex formers, such as condensed phosphates and EDTA, invariably and totally prevent contact precipitation and separation of radionuclides. The contact precipitation increased slightly the separation of Ce-141 and Sr-89. Contact precipitation should be used in purification of radioactive waste water of atomic energy plants. TERTIARY TREATMENT OF COMBINED WASTE WATER,
Calgon Corp., Pittsburgh, Pa. Filtrasorb Dept.; and Cincinnati Univ., Ohio. Dept. of Civil Engineering.
R. H. Zanitsch, and J. M. Morand.
Water and Wastes Engineering, Vol 7, No 9, p 58-60, 1970. 4 fig, 1 tab, 3 ref.

Descriptors: *Carbon, *Tertiary treatment, Industrial wastes, Domestic wastes, Activated carbon, Ohio, Adsorption, Organic matter, Suspended load, Biochemical oxygen demand, Color, Isotherms, Effluents, Microorganisms, Trickling filters, Spectrophotometry, Waste water treatment, California.
Identifiers: *Combined waste water, Cincinnati (Ohio), Pomona (Calif), Lake Tahoe (Calif), Organic dyes, Fluorescein.

The feasibility of removing refractory organic material and dyes from an activated sludge effluent using granular activated carbon was studied. A colorless effluent containing an average of 3 mg/l biochemical oxygen demand and 3 mg/l suspended solids was produced in the 61-day trial. Tertiary treatment with granular activated carbon has been demonstrated in a pilot scale at Pomona, California; a full-scale advanced waste treatment plant is in operation at Lake Tahoe, California. The source of waste water for each of these plants is basically of domestic origin, free of industrial contamination. At the Mill Creek Sewage Treatment Plant in Cincinnati, the influent is a combined industrial-domestic waste containing organic dyes, one of which is fluorescein. The green fluorescein color is soluble and, therefore, is not removed by primary treatment. In a preliminary test, an adsorption isotherm study was conducted on a grab sample; the isotherms demonstrated that the soluble organic carbon level of secondary effluent could be significantly reduced by adsorption on activated carbon. The carbon columns were used as both a filter and an adsorber. The fluorescein dye color bodies were effectively removed by adsorption on the granular carbon. (Jones-Wisconsin)

BIOCHEMICAL OXIDATION OF HYDROCARBONS IN NATURAL WATERS,
Rhode Island Univ., Kingston. Dept. of Bacteriology.
Chester W. Houston.
Available from NTIS as PB-197 585, $3.00 in paper copy, $0.95 in microfiche. Completion Report, Rhode Island Water Resources Center, (1971). 34 p, 4 tab, 15 fig, 10 ref. OWRR Project B-020-RI (1).

Descriptors: *Hydrocarbons, Kinetics, Cultures, *Oxidation, Temperature, Cytological studies, Productivity, *Fermentation.
Identifiers: *Heptane, Continuous culture, Microbial oxidation, *Cell growth rates.

A study of the kinetics of microbial oxidation of hydrocarbons was carried out using a one organism-pure hydrocarbon system (Pseudomonas aeruginosa-heptane). In batch culture, heptane supply is growth limiting at a cell concentration of 3 g/l on a dry basis. The cell concentration was increased to 8 g/l when heptane was volatilized in the influent air to increase interfacial area and mass transfer. Specific growth rate is increased by temperature more than can be accounted for by the effect of temperature alone on growth rate. The effect is attributed to the higher solubility of heptane at the higher temperature. Wash-out characteristic of continuous cultures on heptane differ from the theoretical and is explained on the basis of mass transfer limitations. Steady-states are possible at dilution rates higher than those predicted from batch cultures. Productivity was found to be 1.5 g/l/hr at D—0.26 with a heptane feed rate of 18 ml/hr. Limitation of magnesium or iron in the heptane limited cultures resulted in a marked increase in heptanoic acid production; heptane growth cells had a markedly higher lipid content than those grown on glucose.

Descriptors: *Water pollution control, *Desalination, *Drainage water, Electrodialysis, California, Drainage effects, Reverse osmosis, Water pollution sources, Drainage programs.
Identifiers: *Central Valley (Calif), *Groundwater pollution control.

Experiments were conducted from June 1967 to November 1968, on the desalination of agricultural tile drainage waters near Firebaugh, California. The water used in these studies was collected by a system of tile drains servicing a 400-acre field. These waters, which have percolated through 5 to 9 feet of soil, contained a total dissolved solids (TDS) concentration of from 2,500 to 8,000 mg/liter. Desalination of San Joaquin Valley tile drainage water was found to be technically feasible. The initial reverse osmosis stack was able to achieve over 90% TDS removal; however, nitrate and boron removals averaged less than 27%. The electrodialysis unit had an average TDS removal of 23%. The cost of supplies and power for reverse osmosis (Stack II) was $0.41 per thousand gallons of product. The same costs for electrodialysis came to $0.15 per thousand gallons of product. BACTERIAL DENITRIFICATION OF AGRICULTURAL TILE DRAINAGE,
Federal Water Quality Administration, Fresno, Calif. San Joaquin Project; and Stanford Univ., Calif. Dept. of Environmental Engineering.
Thomas A. Tamblyn, Perry L. McCarty, and Percy P. St. Amant.
In: Collected Papers Regarding Nitrates in Agricultural Waste Waters, Federal Water Quality Administration Water Pollution Control Research Series 13030 ELY, 12/69, p 107-121, December 1969. 15 p, 3 fig, 2 tab, 19 ref. FWQA Project 13030 ELY.

Descriptors: *Waste water treatment, *Water pollution control, *Denitrification, *Biodegradation, *Drainage water, California, Drainage programs, Anaerobic bacteria, Anaerobic conditions, Lagoons.
Identifiers: *Central Valley (California), *Bacterial denitrification.

Initial field studies in the Central Valley of California of bacterial denitrification of irrigation waste water in simulated deep ponds indicated that significant denitrification could take place in ponds with detention times as low as 5 days. Covered ponds consistently outperform the uncovered one. Large algal populations develop in uncovered ponds and the resultant high dissolved oxygen concentration inhibits denitrification. More influent is short-circuited through the uncovered pond because of wind mixing and temperature variations. Treatment in either anaerobic ponds or filters will most likely cost between $30 and $60 per million gallons of waste treated. Agricultural tile drainage can be biologically treated and discharged to the San Francisco Bay System at less cost than that of any alternative plan. (See also W71-04546) (Knapp-USGS)

Identifiers: *Central Valley (California), *Bacterial denitrification.

Algal assimilation of nutrients into cellular material with subsequent removal from the growth medium is a feasible process to remove nitrates from irrigation waste water. The efficiency of the proposed system is greatly enhanced if as many variables as possible are optimized, leaving only nitrogen the limiting nutrient. Orthophosphate additions of 2.0-3.0 mg/liter P are required the year round to remove 20.0 mg/liter nitrate-nitrogen from the growth medium. Iron and carbon also have been found to be limiting algal growth and nitrogen assimilation during part of the year. (See also W71-04546) (Knapp-USGS)

Identifiers: *Central Valley (California), *Bacterial denitrification.

Laboratory culture experiments were made to determine the effectiveness of the two biological processes under investigation, algal stripping and bacterial denitrification, for removing the algal growth potential of the tile drainage water when added to potential receiving waters in the Sacramento-San Joaquin Delta. Algal growth potential tests in two different laboratories indicate that nitrate-rich agricultural drainage, when mixed with San Joaquin River Delta water, stimulates algal growth. Selective removal of nitrate-nitrogen by anaerobic denitrification or removal of nutrients by algal cells grown in shallow ponds yielded comparable bioassay results. Eutrophication due to agricultural waste waters can be controlled by treatment. (See also W71-04546) (Knapp-USGS)

Current plans call for treatment of agricul waste water for nutrient (nitrogen) removal the proposed San Luis and Master Drains pri discharge into the Bay-Delta Area. Of the se treatment processes being investigated, the a stripping process is estimated to require betw 6,000 and 12,000 acres of land to accomplish task. Because every body of water is a pote algal growth system, there are several alterna which will greatly reduce the total cost of treatm and perhaps improve the overall efficiency nutrient removal. In-Line Treatment using drain and the drainage reservoirs for algae gr may be an economical and practical method nutrient removal. Because Kesterson Reservo an integral part of the proposed drainage sy and contains the required area needed for t ment by algae stripping, it seems logical to use a dual-purpose treatment and storage reser Kesterson Reservoir, if modified as suggested, the potential to provide nitrogen removals in ex of 90%. conceptual engineering study concerns the
mation of combined sewer overflows and
zation of the reclaimed waters in a major water-
ted recreational facility for the District of
mbia. The investigation encompasses a com-
ensive solution of environmental problems by
osing multi-use objectives and facilities. Prin-
objectives of the project included: (1) evalua-
of rainfall runoff relationships for sizing of
ge and treatment plant capacities; (2) confir-
on of treatment feasibility using filtration and
tivated carbon process; and (3) development
fficient data for preliminary design purposes.
ratory studies not only demonstrated process
bility, but showed the need for including floc-
ion and sedimentation for removal of minute
cles, together with chlorine and iodine addi-
or maximum disinfection. The recommended
ge/treatment plant provides for a 175 million
storage basin, a 50 million-gallon-per-day
nation facility and two 46-acre swimming and
ng lakes. Cost effectiveness (Cost/Benefit
) of the project, as envisioned, has been in-
d to be 1.6 at an estimated total project cost
5,200,000, and an estimated annual operating
of $1,777,000. Implementation of the
sed plan would not only provide a least-cost
ative over single-purpose projects to attain
cal objectives, but would also reduce the an-
pollution now discharged by the Northeast
lary Trunk Sewer by approximately 99 per-

erature on household water quantity and
requirements was reviewed, an average
se pattern postulated, and the amount of
ed in various household functions was esti-
Comparisons of different water saving
were made on a cost basis. Water quality is
ed from three points of view: health,
cs, and engineering suitability. The future
mands may necessitate very strict disposal
ents and multiple water quality levels
the present standards do not tend to allow
of several levels of water quality such as
ndering effluent for toilet flushing. Waste
problems of homes not connected to cen-
rage systems were discussed. Septic tanks,
f phase processes, membrane processes,
tic processes, and other processes were evaluated, mainly on a cost basis. Most of the methods considered do not appear to be suitable for individual households at this time but with changes in economic factors and technical improvements some of these methods may be attractive for future use. A survey of homeowners, architects-engineers, plumbers and plumbing equipment manufacturers was conducted to obtain representative reactions to methods used to control water quantity and quality and waste water treatment processes. It was found through these surveys that opinions formed from the literature survey was not contrary to popular practices and beliefs. (Ellis-Texas)

A NEW DEVICE FOR WASTE WATER TREATMENT SLUDGE CONCENTRATION,
Smith and Loveless, Lenexa, Kans.
Brian L. Goodman, and Robert B. Higgins.
Water and Wastes Engineering, p 30-32, August 1970. 3 fig.

Descriptors: *Waste water treatment, *Sludge treatment, Activated sludge, Anaerobic digestion, Dewatering.
Identifiers: *Sludge concentrator, Smith and Loveless (Lenexa, Kans).

Research pertinent to dehydration of solids yielded a new waste water treatment employing the S and L Sludge Concentrator. This device utilizes gravity and pressure dewatering to increase the content of solids of sludges prior to their disposal. The concentrator includes a feed pump, polymer system, sludge thickener, and a two-stage dewatering unit. The equipment can be utilized in a variety of waste water treatment processes, such as activated sludge, sludge drying beds, and anaerobic digestion. The cost for chemicals have been in the range of $5 to $15 per ton of dry solids; the cost for electric current is about 16 cents per hour of operation. (Wilde-Wisconsin)

ECONOMICS OF TREATING SEWAGE AND TRADE WASTES,
Babtie, Shaw and Morton, Glasgow (Scotland).
R. M. Bradley.
Effluent and Water Treatment Journal, p 526-530, 1970. 1 fig, 4 tab, 19 ref.

Descriptors: *Sewage treatment, *Sewage effluents, Population, Oxidation lagoons, Filtering systems, Cost comparisons, Economic feasibility, Industrial wastes, Municipal wastes.
Identifiers: *Packaged treatment plants, Plastic media filters, England, Small populations.

Both capital and operating costs of sewage treatment are analysed with the conclusion that some unconventional types of sewage treatment (packaged treatment plants) serving populations less than 1000 are economical. Comparative costs of treatment by biological filtration, oxidation ditch, and packaged plants are given. On-site industrial sewage plants are more economically operated than those of equivalent capacity for municipal sewage works, according to cost breakdowns. Although unconventional types of sewage treatment are associated with industrial wastes, they would be feasible for municipal waste processing. Recent operational results indicate that oxidation ditches produce a consistently satisfactory effluent although operational costs are higher than for conventional works but the more reliable effluent quality at such low population cost is compensatory; especially when debt charges are considered, the advantage of both oxidation ditches and packaged plants becomes even more attractive. High-rate biological filters using plastic media have their bigger impact for on-site industrial waste treatment and for relief of overloaded existing systems and reduction in land area. Data shows that industrial treatment plant construction is 50% of equivalent municipal sewage works. (Auen-Wisconsin)

PROTOZOA IN BIOLOGICAL SEWAGE-TREATMENT PROCESSES--I. A SURVEY OF THE PROTOZOAN FAUNA OF BRITISH PERCOLATING FILTERS AND ACTIVATED-SLUDGE PLANTS,
Water Pollution Research Lab., Stevenage (England).
C. R. Curds, and A. Cockburn.
Water Research, Vol 4, p 225-236, 1970. 3 fig, 2 tab, 12 ref.

Descriptors: *Activated sludge, *Waste treatment, *Protozoa, Filters, Industrial wastes.
Identifiers: *Ciliated protozoa, *Percolating filters, England, Scotland, Ciliates, Flagellates, Amoeba.

Microscopic examination of effluent from percolating filters and mixed liquor from activated-sludge plants revealed a predominant presence of ciliated protozoa and occasional occurrence of flagellated protozoa and amoebae. A complete list of species with their abundance and frequency of occurrence is included. Effluents of high quality, delivered by activated-sludge plants, contained a large variety and numbers of ciliated protozoa. Low quality turbid effluents of other activated-sludge plants were free from ciliates of contained only small numbers of a few species. The study failed to disclose any particular component of industrial effluents that is responsible for suppression of protozoan population. (See also W71-04628) (Wilde-Wisconsin)
W71-04627

PROTOZOA IN BIOLOGICAL SEWAGE-TREATMENT PROCESSES--II. PROTOZOA AS INDICATORS IN THE ACTIVATED-SLUDGE PROCESS,
Water Pollution Research Lab., Stevenage (England).
C. R. Curds, and A. Cockburn.
Water Research, Vol 4, p 237-249, 1970. 4 fig, 4 tab, 14 ref.

Descriptors: *Sewage treatment, *Activated sludge, *Sludge digestion, Protozoa, Biochemical oxygen demand, Effluents, Indicators, Measurement.
Identifiers: *Ciliate protozoa, Sludge loads, Holotrichs, Peritrichs, Hypotrichs.

Activated sludges with loading below 0.3 BOD/g mixed liquor suspended solids per day contained the largest number of holotrichs, peritrichs, and hypotrichs, nearly equally distributed. However, the structure of protozoan communities in activated sludges appeared to be influenced by the BOD of the effluent. In turn, a correlation was established between the average effluent quality within the ranges of 0-10, 11-20, 21-30, and -30 mg/l and the taxonomic contents of the sludge. An application of the relationship to other sites proved to be correct in 83% of cases. (See also W71-04627) (Wilde-Wisconsin)

Identifiers: Residence time, Limiting substrate.

A program to incorporate biological denitrification into a waste water treatment system was un-

dertaken with the objective of developing a process that depends exclusively on the carbon compounds contained in the waste water to supply metabolic energy to the microflora. In the experimental program the incoming nitrogenous material was oxidized to nitrate in an aerobic phase and reduced to nitrogen gas in an anaerobic phase. Conditions for developing a nitrifying microflora were investigated using a primary waste water effluent as feed. Flows into the system were varied to give a range of residence times. Anaerobic batch experiments were carried out to determine if stored reserves could support denitrification. Under appropriate conditions almost 100% of the nitrates could be reduced. The effluent from the aerobic unit served as the feed for the anaerobic process. At appropriate intervals this situation was reversed by switching the airflows and feed sources. Over 95% of the waste water nitrogen in waste water was removed. Nitrate-nitrogen removal rates ranged from 0.600 to 1.00 mg/hr/g MLVS. A mathematical model was developed which described the response to cycled aerobic-anaerobic operation. The alternating cycle approach was shown to be an effective method for removing nitrogen from waste water. (Mechalas-Aerojet)

COMBINED SEWER TEMPORARY UNDERWATER STORAGE FACILITY.
Melpar, Falls Church, Va.

Copy available from GPO Sup Doc as I67.13/4:11022 DPP 10/70, $1.75; microfiche from NTIS as PB-197 669, $0.95. Water Pollution Control Research Series 11022 DPP 10/70, October 1970. 75 p, 12 tab, 16 fig, 2 ref. FWQA Program 11022 DPP.

Descriptors: Storage, *Overflow, *Storm runoff, *Storage tanks, Sewers, Interception, Drainage, *Pumped storage, Costs, *Pumping plants, Maryland.
Identifiers: *Combined sewers, Cambridge (Md), Choptank River, *Underwater storage.

A pilot plant underwater storage facility was designed, constructed, operated and evaluated as a method of temporarily storing storm overflow from the combined sewer of the Choptank Avenue drainage basin, Cambridge, Maryland. Combined sewage in excess of the sewer capacity, which would normally be discharged directly into the Choptank River, was intercepted and pumped into a nominal 200,000 gallon flexible underwater storage container located 1300 feet offshore. The stored overflow was later returned from the tank at a rate which could be accommodated by the intercepting sewer and treatment plant. The facility was tested with overflow both from four naturally occurring rainfalls and using fresh water simulation. The overflow samples were analyzed in a field laboratory for the following characteristics: pH, suspended solids, volatile suspended solids, settleable solids, 5 day biochemical oxygen demand, and chemical oxygen demand. The pilot plant facility was capable of collecting 96 percent of the average annual overflow from the drainage basin at a cost of less than $1.85 per thousand gallons. The facility could prevent the annual discharge of 7,136 pounds BOD into the Choptank River. Underwater storage facilities could be used effectively for a number of combined sewer areas. Site selection, however, has been proven to be a critical factor. Care must be exercised to prevent public disturbance, and factors such as land use, tidal conditions, or the types of storms, must also be considered. (Meloy-Melpar)

Descriptors: *Reverse osmosis, *Sewage treatment, Tertiary treatment, Computer models, *Membrane processes, Demineralization, *Osmosis, *Waste water treatment, Municipal water, Solid wastes, Organic wastes, Costs.
Identifiers: Process models, *Municipal waste water, Solids removal, Organics removal.

A fifteen-month laboratory program has shown that all grades of municipal waste water may be significantly improved by the reverse osmosis process. Comparisons are provided on the behavior and response of the reverse osmosis process to carbon-treated secondary sewage, alum-treated secondary sewage, secondary sewage, primary settled sewage, raw sewage, and digester supernatant. High removals of dissolved minerals, organic substances, and suspended matter have all been achieved in the same treatment. The effects of a flocculant, dispersant, chelating agent, enzyme, and acid on reducing product water flux decline are compared. The relative effects of reverse osmosis test-cell geometry on solids deposition and membrane performance are presented. A phenomenological model is postulated describing the role of undissolved solids and organic substances in producing product water flux decline and the subsequent maintenance of constant product water fluxes. A computer model of the reverse osmosis process, compatible with the executive program written by the Federal Water Quality Administration, has been developed to provide an accurate and rapid method of determining the design and cost of reverse osmosis facilities. APPLICATION OF HYPERFILTRATION TO TREATMENT OF MUNICIPAL SEWAGE EFFLUENTS,
Oak Ridge National Lab., Tenn. Water Research Program.
Kurt A. Kraus.
Copy available from GPO Sup Doc as I67.13/4:17030 EOH 01/70, $0.70; microfiche from NTIS as PB-197 671, $0.95. Water Pollution Control Research Series 17030 EOH 01/70, January 1970. 71 p. FWQA Program 17030 EOH.

Descriptors: Waste water treatment, *Filtration, *Membranes, Membrane processes, Effluents, Municipal wastes, Sewage effluents, *Sewage treatment, *Electrolytes, Ion exchange.
Identifiers: *Hyperfiltration, Membrane additives.

A large number of membranes dynamically formed from polyelectrolytes on fine-grained (ca. 0.5 micron) supports or filters were tested for application in hyperfiltration of effluents from the primary and secondary stages of a municipal sewage treatment plant. Since results with primary effluents were not significantly different from those with secondary, most of the later studies were limited to primary effluents. The dynamic membranes were principally examined for salt rejection, organic rejection, flux, and flux decline with time. Cation-exchange membranes formed from anionic polyelectrolytes were generally superior to anion exchange membranes from polycations. Membranes formed from (unidentified) sewage constituents, while rejecting salts and organic materials, seemed inferior to separately formed dynamic cation-exchange-active membranes. In earlier studies, membrane additives were continuously supplied to the feeds. In later runs, which extended to several weeks operation at the sewage plant, such continuous addition did not seem required, at least for some of the more promising membrane additives tested, such as those formed from homogenized Dowex-50, homogenized Sephadex, and for a dual-layer membrane composed of hydrous zirconium oxide and polyacrylic acid. With these membranes, upward of 50% salt rejection was frequently found, together with higher alkaline earth and organic rejections at initia
of 100 gfd and higher. Salt rejection in ex
50% at fluxes in excess of 50 gfd were found
of the cases after 20 hours operation. At hig
lation velocities (larger than 20 ft/sec), flux
was usually modest, and fluxes in excess of
were often observed after two weeks' operat

The recently constructed $2,223,944 wast
reclamation plant of the Santee County Wa
trict is recognized as being the most ad
facility of its kind in the world. The plant,
only 14,500 persons, was built in lieu of
with other nearby communities in for
metropolitan sewer system designed for dis
waste water into the Pacific Ocean. The
reason for the adoption of a water recla
system was the extremely high cost of mu
water which is presently imported fro
Colorado River, more than 300 miles. The
completed in January 1968, consists of
sewage pump station, a 3.2-mile long sewag
main, an activated sludge treatment plant co
with sludge disposal facilities plus an ox
pond, an effluent pump station, and a 1.9-m
effluent distribution force main, all of whic
integral part of the existing recreational la
water reclamation facilities. The raw se
pumped up Sycamore Canyon for processin
new treatment plant. The effluent flows bac
the canyon through an oxidation pond and
ing basins, and thence is filtered through
underground aquifers into the recreation
system from which effluent for distribu
pumped. The reclaimed water is used for
tional, agricultural and industrial purposes.
treatment and disposal is accomplished by

Volatile suspended solids, Cincinnati (Ohio

Increasing demand for water supplies, and
demand for pollution abatement has led to
of the part played by precipitation and stor
runoff. Inorganic nitrogen and hydro
phosphate concentrations in rainwater wer
to be .69 mg/l and 0.24 mg/l respectively: b

ceed Sawyer's threshold level for algal bloom. In addition, several different chlorinated organic hydrocarbon pesticides have been isolated and identified in rainfall at Cincinnati. Several water quality parameters of stormwater runoff were also investigated. Coliform densities greater than 2900/100 ml were found in 90% of the samples tested, high above the 1000/.100 ml standard applied for recreational water. Stormwater runoff also contains a high level of suspended solids, many of which are not amenable to removal by sedimentation. During runoff, stormwater runoff constituent discharge rates, expressed as percentage of average raw sewage constituent production rates at population density of 9 persons/acre are: suspended solids; 2400%, COD;520%, BOD, 110% total hydrolyzable phosphate, 70%; and total nitrogen, 200%. From this analysis it is obvious that although stormwater runoff must contribute to water supplies in the future, it will require extensive treatment before it is fit for use as a potable water source. n activated sludge process can be regulated solely the basis of organic load and sludge activity. In is way, sludge concentration, expressed as the acity can be adjusted for maximum efficiency durg either maximum load, or the 24 hour average ad. The activity of dehydrogenases of the acated sludge responds so fast that a relationship tween the activity and the loading can be tablished over as short as a two hour period. nce activity, Y, is determined by the dry sludge ss, x, and the organic loading, and there is a rect relation between Y and the purification efct, a, then the purification efficiency per unit lume is obtained by multiplying x by a. Therere, because of the inter-relations, a, can be obned when both x and y are known. Careful moniing of x versus y and the sludge volume index alvs operators to quickly determine what the conion of the sludge inside the tank is, and hence an erator can prevent failure by spotting slugs of ic material which may be entering the process. e also W71-04689 and W71-04690) (Lowry-xas)

ifference in the level of turbulence will cause a erence in the level of biological activity in an vated sludge tank. However, measurements must be taken at the temperature at which the aeration tank is operating. If a different temperature is used to incubate the samples then results cannot be considered accurate. Lenhard, Nourse, and Schwartz recommend adjusting the pH of the solution during the standard test but this would cause the conditions to deviate from actual aeration tank conditions. Enzymic activity depends on the fact that the enzyme proteins are polyvalent dipolar ions which can exist in a number of forms depending upon the pH value of the substrate. Some of these forms are more active than others, resulting in considerable experimental error. Biological population changes in response to changes in the organic loading. Generally lower loads were characterized by protozoal sludge, while higher levels of loading resulted in bulking or filamentous sludge. A pilot plant activated sludge unit was operated in order to establish the relationship between total dehydrogenase activity and oxidation-reduction potential. The samples were kept at the temperature of the mixed liquor in the aeration tank. Dissolved oxygen content varied between 1 and 2 mg/l. Increasing dehydrogenase activity resulted in decreased oxidation reduction potential in the mixed liquor. However, the gradient of the line expressing the relationship of the two values was given by the technical and technological conditions of the activated sludge process. Identifiers: TTC, Formazone, *Endogenous respiration, Staining, Zoogloeal, MLSS, Biological load.

The TTC method for determining the 'activated sludge activity' reveals several different factors pertinent to the operation of an activated sludge plant. First of all, the TTC method can be used to determine the biological degradability of a particular substrate. The substrate activity, Y, depends on the organic loading. The increase in activity of a sludge in the endogenous respiration stage characterizes the activity of the substrate that was added. From these conclusions, it is obvious that the concentration of the active mass, Ma, if well estimated, may offer a far better design base that the conventional MLSS. Secondly, the TTC method was used to determine the accessability of oxygen to all parts of the sludge. TTC in the presence of oxygen is not reduced, so addition of TTC to a sludge blanket will result in stained sections only where the oxygen is not able to reach. This provides useful information concerning power levels and mixing intensity. Finally, TTC can be used to check the effluent quality of treatment plants. Overloading of an activated sludge installation results in dispersed growth of bacteria and poor settling characteristics. When incubated with TTC, poor quality effluents exhibit a purple color, the intensity of which is directly related to the number of free-swimming bacteria. (See also W71-04688) (Lowry-Texas)

NONIONIC DETERGENTS AND RELATED SUBSTANCES IN BRITISH WATERS,
Ministry of Technology, London (England). Lab. of Government Chemist.
Stella J. Patterson, K. B. E. Tucker, and C. C. Scott.
Proceedings of the Third International Conference on Water Pollution Research, Munich, Germany, 1966, p 103-116. 2 fig, 4 tab, 10 ref.

Descriptors: *Degradation, *Detergents, *Foaming, Chromatography, Chemical analysis, Sewage, Effluents, Industrial wastes, Waste water treatment, Biodegradation, Aromatic compounds, Linear alkylate sulfonate.
Identifiers: *Polyglycols, *Nonionic detergents, *Anionic detergents, Aire River, Calder River, Synergism, Alkyl phenol-9-ethylene oxide.

Thin layer chromatographic techniques were developed to analyze river water for the presence of nonionic and anionic detergents and also polyglycols. Chromatographic techniques were used since none of the available chemical processes had the sensitivity required. It was found that 'hard' nonionic material and polyglycols degrade very slowly, and much residual concentration is present even after considerable time has passed. 'Soft' nonionic materials, on the other hand, degrade very rapidly and present little problem. The majority of rivers analyzed contained .01 mg/l or less of nonionic detergents while 3 rivers serving highly industrialized areas contained between .1 and .25 mg/l. Anionic detergents ranged from .1 to 1.8 mg/l with an average of .4 mg/l. In view of the synergistic effects which such detergents are known to possess, suitable combinations of detergents of this level can, and in fact do cause serious foaming problems. DISCUSSION OF 'NONIONIC DETERGENTS AND RELATED SUBSTANCES IN BRITISH WATERS',
Federal Water Pollution Control Administration, Cincinnati, Ohio.
M. B. Ettinger.
Proceedings of the Third International Conference on Water Pollution Research, Munich, Germany, 1966, p 112. 3 ref.

Descriptors: *Detergents, *Linear alkylate sulfonate, *Aromatic compounds, Biodegradation, Biochemical oxygen demand, Waste water treatment, Chromatography.
Identifiers: *Polyglycols, Alkyl alcohol ethoxides, Nonionic detergents, Phenol derivatives, Alcohol derivatives, Aromatic ethoxides.

Degradation of polyglycols or nonionic detergents does not necessarily mean that there will be no remaining residues with surface active properties or other undesirable characteristics. The extraction procedure and the extract washing procedure used in thin-film chromatographic analysis seem unlikely to recover many glycol chain residues which have been shown to be at least moderately resistant to biodegradation. Field studies at treatment facilities revealed some penetration by biodegradable materials of five different secondary sewage treatment systems. Therefore adequate treatment will not completely solve the problem. (See also W71-04691) (Lowry-Texas)

DISCUSSION OF, 'NONIONIC DETERGENTS AND RELATED SUBSTANCES IN BRITISH WATERS',
Koniklijke/Shell-Laboratorium, Amsterdam (Netherlands).
P. L. Kooijman.
Proceedings of the Third International Conference on Water Pollution Research, Munich, Germany, 1966, p 113-114. 1 ref.

Descriptors: *Chromatography, *Detergents, Biodegradation, Waste water treatment.
Identifiers: Chloroform extraction, Cobalto thiocyanate method, Polyethylene glycol, Ethylene oxide, Carboxylate.

The cobalto-thiocyanate method color formation with nonionics is dependent upon the ethylene oxide content of the nonionics. If the ethylene oxide chain of a nonionic is shortened by biological attack, the resultant product may intensify the color of the complex, thus resulting in considerable error. The thin layer chromatographic method is not subject to error from this source. Thin layer chromatograms have distinguished between nonionic and polyethylene glycol. If complete separation is possible, it should be possible to analyze intermediate products of biodegradation. (See also W71-04691) (Lowry-Texas)

Identifiers: Chloroform extraction, Polyglycols, Alkylphenon ethylene oxide, Carboxylate, Hard nonionic detergents, Soft nonionic detergents.

Several factors have combined to hamper the study of the biodegradation of nonionic surfactants, and the detection of their presence in water. The surfactants are present only in extremely dilute solution when compared to potentially interfering materials. In addition, biodegradation itself proceeds through a series of steps involving many times the formation of complicated complexes which are difficult to monitor in their degradation processes. A degrading system may contain not only the original molecules, but hosts of new and different compounds to confuse the issue still further. Other compounds may be more easily extracted with chloroform resulting in considerable error in the resulting thin film chromatographs. Therefore, it would seem that thin film chromatography must undergo further research and development before being regarded as a precise investigative tool. (See also W71-04691) (Lowry-Texas)

AEROBIC SLUDGE STABILIZATION IN SEWAGE TREATMENT PLANTS,
Technische Hochschule, Hanover (West Germany).
Dietrich Kehr.
Proceedings of the Third International Conference, Munich, Germany, 1966, p 143-152. 7 fig, 19 ref.

Descriptors: *Biodegradation, *Digestion, Organic loading, Microorganisms, Nitrogen, Phosphorus, Biochemical oxygen demand, Industrial wastes, Municipal wastes, *Sludge, Sewage treatment, Waste water treatment.
Identifiers: *Aerobic sludge stabilization, Technical digestion limit, Stabilized sludge, Sludge age, Sludge load.

Aerobic sludge stabilization and its economic and technical aspects have been investigated as a substitute for the use of large digesters employed in the anaerobic digestion process. The general design basis of design of an aerobic stabilization tank is .01 cubic meters/capita, or approximately 30% of the volume of a digester designed for the same load. On the other hand, aerobic stabilization requires energy in the form of pumping and compressors required to put oxygen into the system, whereas anaerobic digestion produces usable energy. Therefore a cost comparison of the two methods should be made in every case in order to determine which is less expensive. Sewage treatment plants serving 10,000 people or less are in many instances already employing joint activated sludge waste treatment and sludge stabilization. Indications are that separate processes are feasible for plants serving up to 100,000 people, if the cost of electrical power is less than 1.2 cents/kw hour. DISCUSSION OF 'AEROBIC SLUDGE STABILIZATION IN SEWAGE TREATMENT PLANTS',
Vysoka Skola Chemicko-Technologicka, Prague (Czechoslovakia).
Jan Chudoba.
Proceedings of the Third International Conference on Water Pollution Research, Munich, Germany, 1966, p 153-157. 1 fig, 17 ref.

Descriptors: Digestion, Synthesis, Kinetics, Stabilization, Organic loading, Biodegradation, Chemical oxygen demand, Biochemical oxygen demand, Activated sludge, Water purification, Sewage, Aeration, Waste water treatment.
Identifiers: *Endogenous metabolism, *Sludge yield coefficient, *Sludge age, *Extended aeration, Volatile suspended solids, Mixed liquor suspended solids.

Two methods of aerobic sludge stabilization are presently employed in practice. Extended aeration has long been practiced, and for it to operate optimally, the following guidelines must be followed. Detention time in the aeration tank must be 24 hours, followed by 4-6 hour sedimentation time, while the organic loading must be from 240-320 g BOD5/day/cubic meter and the sludge loading cannot exceed .1 g BOD5/day/g Vss. Problems which occur are mainly due to poor sludge settleability, causing much of the organic material to pass through the outlet in the form of suspended solids. Formulae have been developed to determine the amount of non-degradable material which will remain, and the amount of degradable material which will be oxidized. The second method consists of separate aeration of sludges under continuous or discontinuous conditions. For this type of treatment, the aeration period is a function of certain sludge characteristics, notably the volatile suspended solids content. Experiments showed that higher volatile solids removals were effected at the lower loading rates. Temperature is also a significant factor. The higher the loading rate, the less the sludge will settle, and this usually requires installation of some additional sludge handling device, or separate sludge aeration tank. DISCUSSION OF 'AEROBIC SLUDGE STABILIZATION IN SEWAGE TREATMENT PLANTS',
Texas Univ., Austin.
Joseph F. Malina, Jr.
Proceedings of the Third International Conference on Water Pollution Research, Munich, Germany, 1966, p 157-160. 1 tab, 4 ref.

Descriptors: *Anaerobic digestion, *Aerobic treatment, *Stabilization, Organic loading, Degradation, Synthesis, Microorganisms, Ammonia, Oxidation, Activated sludge, Waste water treatment.
Identifiers: *Primary sludge, Oxygen consumption, Detention Time, Volatile solids.

Much data has been accumulated to determine the relative merits of aerobic versus anaerobic sludge stabilization. The data presented here show significant advantages for the anaerobic method when dealing with primary sludge. The anaerobic process has a much lower growth rate, consequently more of the organic material is destroyed rather than synthesized into new cell material. Carbon removals and ammonia nitrogen production also achieved much higher levels in the anaerobic process. The amount of volatile solids destroyed anaerobically increased with increased organic loading, whereas the amount destroyed aerobically remained essentially constant. When dealing with waste activated sludge, however, the outlook is much changed. The much lower content of volatile solids and higher difficulty of degrading products which are already fairly well stabilized m
utilization of anaerobic treatment, although p
ble, economically unfeasible in the degradatio
waste activated sludge. Therefore, the dec
between aerobic and anaerobic treatment ca
be based solely on the systems themselves, but
also be a function of the waste to be treated.

ee basic types of sludge water have been dealt . In order of increasing difficulty of separation, are interspace water, adhesion and capillary er, and adsorption and internal water. Work is uired to overcome the liquid-solid binding es to dewater the sludge. The influence of ity is enough to remove interspace water, but hanical dewatering devices are needed to cope the other waters. Calcium hydroxide, when in the presence of metal salts or carbon diox- reduces the binding forces which hold the id to the solids. The effective range, however, is icted to the water binding. The overall in-igations did confirm the utility of lime as an ef-ve and economical aid in sludge dewatering. also W71-04699) (Lowry-Texas)

USSION OF 'EFFECTS OF SLUDGE CON-ONING WITH LIME ON DEWATERING',
Hertfordshire Main Drainage Authority, answorth (England).
rd Wood.

Proceedings of the Third International Conference on Water Pollution Research, Munich, Germany, 1966, p 192-194. 1 tab.

Descriptors: *Lime, *Dewatering, Vacuum drying, Activated sludge, Sewage, Sludge disposal, Waste water treatment.
Identifiers: *Lime-bonding capacity, Flash-drying, Pressure filtration, Chlorinated copperas, Aluminum chlorohydrate, United Kingdom.

The two principle methods of dewatering in the United Kingdom today are pressure filtration with lime and copperas as sludge conditioners, and vacuum filtration using either chlorinated copperas or aluminum chlorohydrate. Lime has been applied only in situations where a metal filter medium is used. The variability of the activated sludge process itself prevents standard comparisons of pressure filtration versus vacuum filtration. Investigations have revealed, in agreement with other authors, that addition or iron salts after liming produces no change. Skepticism over the ability of lime and CO2 to further consolidate settled solids is expressed, much of the increased solids content being attributed to the lime bonding capacity and the amount of calcium carbonate precipitated. POPULATION DYNAMICS IN BIOLOGICAL TREATMENT PLANTS,
Water Pollution Research Lab., Stevenage (England).
A. L. Downing, and G. Knowles.
Proceedings of the Third International Conference on Water Pollution Research, Munich, Germany, 1966, p 117-136. 10 fig, 1 tab, 13 ref.

Descriptors: Kinetics, *Bacteria, *Protozoa, *Mathematical model, *Biodegradation, Metabolism, Acclimatization, Nitrification, Detergents, Aeration, Hydrogen ion concentration, Activated sludge, Water purification, Biological treatment, Microorganisms, Waste water treatment, Treatment facilities.
Identifiers: *Population dynamics, *Nitrosomonas, Anionic detergents.

Very little basic information is presently known about the relative numbers, activities, and nutritional requirements of the various types of microorganisms that can gain access to activated sludge plants. Predictions of removal of anionic detergents and degree of nitrification based upon population dynamics correspond very well with actual observed values. Mathematical models based on growth and decay rates are formulated to explain the rate of removal of certain substrates. Removal of a particular substrate from a waste water depends upon whether or not conditions existing in the treatment system are favorable for the growth of organisms capable of degrading the substance in question. The critical variables are temperature, pH, detention time, and whether or not any substances specifically toxic to the organism in question are present. Also, a certain acclimatization period may be required to establish the growth of a new organism. Hopefully, a more thorough knowledge of the growth patterns of the mixed microbial populations present in biological reactors will provide more insight into design conditions and procedures in the future. W71-04703

DISCUSSION OF 'POPULATION DYNAMICS IN BIOLOGICAL TREATMENT PLANTS',
Water Economics Research Inst., Warsaw (Poland).
Jerzy Ganczarcyk.
Proceedings of the Third International Conference on Water Pollution Research, Munich, Germany, 1966, p 136-173.

Descriptors: *Mathematical models, *Biodegradation, *Activated sludge, Detergents, Organic compounds, Nitrification, Biological treatment, Waste water treatment.
Identifiers: *Population dynamics, Intermediates, Enrichment, Over-aeration.

The work done by Downing and Knowles is supported, to a large extent, by work done in Poland by Ganczaryck, although several differences were noted. First of all, the sorption of certain substances on activated sludge flocs was selective and did not resemble closely the phenomenon of the Freundlich Isotherm. Also, the substances were often oxidized partially to form equally complicated intermediates, making determination of the biodegradable portion quite difficult. Secondly, the formulations could not explain fully the influence of physical factors on population dynamics, the interaction of activated sludge population in the degradation of some organics, or the limitation of one stage activated sludge processes in the elimination of some difficult organics. (See also W71-04703) (Lowry-Texas)

DISCUSSION OF 'POPULATION DYNAMICS IN BIOLOGICAL TREATMENT PLANTS',
Water Pollution Research Lab., Stevenage (England).
Ross E. McKinney.
Proceedings of the Third International Conference on Water Pollution Research, Munich, Germany, 1966, p 137-140. 3 tab.

Descriptors: *Bacteria, *Protozoa, *Metabolism, Microorganisms, Activated sludge, Detergents, Oxygen demand, Hydrogen ion concentration, Nutrients, Mixing, Oxygen, Temperature, Nitrification, Waste water treatment.
Identifiers: Mixed microbial populations, Pure culture, *Population dynamics, Waste retention time, Empirical, Microbial mass.

The parameters which are controlled by an engineer in an activated sludge plant are, waste retention time, pH, nutrient elements, mixing, oxygen, microbial mass, and temperature. All other elements are fixed by the nature of the waste and the metabolic rates of the microorganisms. Population dynamics should be approached from the fundamentals, rather than from complex empirical mathematics. A very carefully designed and controlled study of the combined bacterial and protozoan system is needed to provide engineers with a better fundamental understanding of population dynamics. (See also W71-04703) (Lowry-Texas)
W71-04705

DISCUSSION OF 'POPULATION DYNAMICS IN BIOLOGICAL TREATMENT PLANTS',
Indian Inst. of Science, Bangalore. Dept. of Biochemistry.
S. C. Pillai.
Proceedings of the Third International Conference on Water Pollution Research, Munich, Germany, 1966, p 140-141.

Descriptors: Microbiology, Biochemistry, Kinetics, Detergents, Nitrification, Protozoa, Bacteriology, Clarification, Activated sludge, Mathematical models, Waste water treatment.
Identifiers: *Population dynamics.

Numerous investigators have discovered that no matter what the origin of the waste being treated, the protozoan population remained constant. Protozoan activity may vary by species, but when taken as a whole the range of variation is so limited as to allow them to be considered a constant. Bacterial populations show no such specialization. Several features of the activated sludge process mechanics are: (1) it is rapid, (2) it removes both harmful impurities and bacteria, (3) successful operation depends upon maximum 'activity' being maintained by optimum aeration conditions, (4) it readily undergoes putrefactive changes in the absence of sufficient oxygen, (5) it increases

greatly in volume during purification. These are the essential features which a satisfactory explanation of the activated sludge process must cover. (See also W71-04703) (Lowry-Texas)
W71-04706

RELEASE OF SOLUBLE ORTHO-PHOSPHATE IN THE ACTIVATED SLUDGE PROCESS,
Kurita Central Labs., Yokohama (Japan).
Yasuhiro Sekikawa, Shozo Nishikawa, Minoru Okazaki, and Kenji Kato.
Proceedings of the Third International Conference on Water Pollution Research, Munich, Germany, 1966, p 261-276. 15 fig, 4 tab, 5 ref.

Descriptors: *Phosphorous compounds, *Activated sludge, *Microorganisms, Industrial wastes, Metabolism, Disinfection, Phenols, Poisons, Biochemical oxygen demand, Waste water treatment, Aerobic treatment, Sludge treatment, *Orthophosphorous compounds.

During periods of unfavorable growth conditions, such as nutrient deficiency, low dissolved oxygen concentration, or the presence of toxic or inhibitory materials, activated sludge cultures will release orthophosphate back into solution. This conclusion, supported by the data presented in the figures and tables, suggests that phosphate variation might serve as an indicator of the physical condition of a biological treatment process. Measurement of phosphate concentration on a continuous basis will provide the plant operator with information as to how well the process is faring in regards to whether the microorganisms are working in as favorable an environment as possible. Further studies under more complicated operating conditions are a necessity in order to more fully understand the physical parameters of the system that are directly related to the change in phosphate concentration, and also those that are directly affected by the conditions which cause variations in the phosphate concentration. (See also W71-04708 and W71-04709) (Lowry-Texas)

Identifiers: Luxury uptake, Assimilation, Adenosine tri phosphate, Biosynthesis, Organic carbon, Protoplasm, Mixed liquor suspended solids, Orthophosphates.

The level of phosphorous in an activated sludge tank has been proposed as an indicator of the activity of the microorganisms in the system. Much variation in phosphorous uptake has been observed in various parts of the world. Phosphorous uptake in excess of normal requirements for biosynthesis is the subject of much debate. Luxury uptake, storage, synthesis of ATP, and adsorption onto the floc are a few of the mechanisms proposed to explain this excess uptake. Regardless of what mechanism causes the uptake, methods of continually monitoring the phosphorous content in the raw sewage, in the areation tank, and in the effluent are necessary before any application of phosphorous level as an indicator of biological treatment becomes practical. (See W71-04707) (Lowry-Texas)

DISCUSSION OF 'RELEASE OF SOLUBLE ORTHO-PHOSPHATE IN THE ACTIVATED SLUDGE PROCESS',
Vattenbyggnadsbyran Ltd., Stockholm (Sweden).
Nils L. G. Westberg.
Proceedings of the Third International Conference on Water Pollution Research, Munich, Germany, 1966, p 281-283. 6 ref.

Descriptors: *Orthophosphorous compounds, *Iron compounds, *Eutrophication, *Dissolved oxygen, Aeration, Microorganisms, Metabolism, Nutrients, Biochemical oxygen demand, Activated sludge, Waste water treatment.

Sewage often contains considerable amounts of iron. This iron occurs mainly as iron hydroxide compounds which possess a high capacity of adsorbing phosphates. If considerable amounts of iron are intermittently present in the influent, the accuracy of the phosphorous level as an indicator of biological activity will be highly questionable. While no iron is present, the role of phosphorous as an indicator of biological activity has been well documented by several investigators. However, when considerable accuracy is necessary, this method falls short. Oxygen concentration has long been accepted as an indicator of biological activity, and with the advent of improved continuous dissolved oxygen monitors, it is doubtful that any other indicators should be preferred to dissolved oxygen level. THE INACTIVATION OF ENTEROVIRUSES IN SEWAGE BY CHLORINATION,
Technion - Israel Inst. of Tech., Haifa.
Hillel I. Shuval, Samuel Cymbalista, Alberto Wachs, Yitzhak Zohar, and Natan Goldblum.
Proceedings of the Third International Conference on Water Pollution Research, Munich, Germany, 1966, p 53-69. 4 fig, 12 ref.

Descriptors: *Viruses, *Coliform, *Vircide, *Chlorination, Waste water treatment, Sewage, Enteric bacteria.
Identifiers: Plaque forming units, Residual, Contact time, Hydroextraction, Haifa, *Poliovirus, *Echovirus, Inactivation, Israel.

The inactivation by chlorine of echovirus and poliovirus was compared with the inactivation of coliforms by chlorine in the Haifa, Israel sewage treatment plant. The pH ranged from 7.7 to 7.8, and the experiments were carried out at 20 plus or minus 2C. The chlorine formed complexes which are lower in disinfection ability than free chlorine. Chlorine residual was always above .3 milligrams per liter. Echovirus followed known inactivation patterns which were a function of time and chlorine concentration, being 99% inactivated after 30 minutes at 3.6 milligrams per liter of chlorine. Poliovirus was less sensitive with 50% and 90% reduction in 6 hours with 5 and 8 milligrams per liter respectively. The inactivation of echovirus was somewhat comparable to that of coliforms although the overall study indicated that coliform index in chlorinated sewage may not give a true picture. Inactivation of viruses seeded in sewage in concentrations many times greater than those normally present in sewage may not be representative of actual field situations. To carry out studies with normal wild virus concentrations, methods for detecting minimal virus concentrations as low as 1-10 plaque forming units, per liter are required. tion, Trickling filters, Coliform, Bacteria, Se
treatment, Waste water treatment.
Identifiers: *Enteroviruses, Inactivation, viruses, Echovirus 12, Coxsackie A9, streptococcus, Plaque counts, Hydro-extra
Chlorine residual.

Virus inactivation was monitored in primary ment facilities, trickling filters, activated sl and chlorine disinfecting units. It was found th tle or no virus inactivation occurred in pri treatment, and that the effluents from seco treatment facilities contained viruses as often the raw sewage. The trickling filter reduce levels somewhat, but still did not provide a r virus free effluent. The activated sludge unit vided 90% removal of poliovirus, and 98% re of Coxsackie A9 virus. Bacterial reductions much less subject to variation in these tests were viral reductions. Studies indicated tha mg/l concentration residual of chlorine during minute contact time would be sufficient to tivate viruses. Raw sewage chlorinated to lev .1 to .3 mg/l showed no reduction of active vi over non-chlorinated effluents. From this anal was evident that chlorination as it is now being dled is not sufficient to prevent viral growth. work is needed to provide methodology with to analyze viral concentrations in water san Also, residual chlorine measurements mus taken along with the samples in order to deter whether a virus is particularly virulent, or wh the chlorine has been reduced to a biological active level. (See also W71-04710). (Lowry as)

Identifiers: Staphylococcus phage 3C, Sodiu Poliomyelitis, Clarification, Emscher tank.

A municipal sewage treatment plant, having a sewage from a combined sewer as influent, consisting of an Emscher tank, trickling filter final settling tank, was seeded with staphyloco phage 3C. 15 minutes after the phage see radioactive sodium was added. Concentrati the phages was monitored at the outlets to the stages of the treatment plant, as was the lev radioactivity. The flow through curves were graphed and included in the report. 66% o phage particles passed through the plant and the receiving stream. This experiment was duplicated in a similar plant with similar re Although not all viruses behave in exactly the manner as the particular phage used, many do quite similarly. From these test results it was ous that plants of this type do not provide ade inactivation of viruses, and they must be redesi or replaced. (See also W71-04710). (Lowry as)

, Food to micro-organisms ratio, Mechanical
ppressor, Filamentous sludge, Oxidation rate.

he combination of factors known as the aeration
ace activity is the new basis for activated sludge
sign work. Activated sludge dry weight, where
e food to microorganism ratio does not approach
e state of non-flocculent growth is unable to
present the purification capacity of an activated
dge tank reactor. The aeration space activity can
determined by an experiment in which all
ocess parameters must be applied in full scale, in-
uding the mixing factor. In most cases, the mixing
ctor influences the aerated space activity to a
ch greater extent than does the sludge loading
ctor. As long as high oxygenation capacity is
quired, then the power requirements are not sig-
icantly different for the several types of aerators,
d consequently, the power requirement is not a
termining factor in the aeration system design.

spite much research on the subject, the
ponents of small bubble aeration are still in dis-
eement with the proponents of large bubble
ation as to which bubble size is actually optimal
activated sludge. Experiments conducted at the
ification Plants of the City of Paris, the Depart-
nt of the Seine, the Experimental Center at
ombes, and the Purification Plant of Acheres
port the coarse or medium bubble system as
viding the greatest overall benefit for the ac-
ted sludge system. The differences in aeration
ciencies between large and small bubbles
ome smaller as the oxygenation capacity
omes larger. Also, larger bubbles break up the
wth patterns of filamentous organisms, while at
same time providing the best use of the aeration
ver for flocculating the sludge blanket and set-
g organic substances on the sludge. The
kman electrode was used to obtain values of
olved oxygen present in a sample of activated
ge. This equipment is correct only within 10%,
the most economical design will not be possible
l oxygen levels at all points in the tank at all
es can be continuously monitored. (See also

ot plants, Aeration, Turbulence, Activated
ge, Waste water treatment.
ntifiers: Contact frequency, Specific surface,
nminution, Specific aeration intensity, Mixing
, Sludge loading, Oxygen transfer.

Turbulence activates the biological processes according to work done at the Ruhrverband in Germany over the past several years. Oxygen uptake is a function of the frequency of contact which increases in proportion to the velocity gradient. Increased velocity gradient G, provides increased shear forces proportional to G to the 2nd power. These shear forces mechanically comminute the floc, giving it a larger specific surface for the biological activities. Sludge loading, then, expressed in Kg BOD5/day/Kg dry solids can be used only as an auxiliary term. Experiments also showed that bubbles flowing into an aeration tank were subjected to too many unknown or incalculable influences to follow a strict mathematical derivation. The geometric conditions of an aeration tank were proven to be of considerable significance, especially for the judgement of experimental results. Oxygen transfer experiments showed medium bubble aeration to achieve nearly the same transfer rate under similar conditions as fine bubble aeration. (See also W71-04713). (Lowry-Texas)

DISCUSSION OF 'THE ROLE OF AERATION IN THE ACTIVATED SLUDGE PROCESS',
Technische Hochschule, Vienna (Austria).
Wilhelm Von Der Emde.
Proceedings of the Third International Conference on Water Pollution Research, Munich, Germany, p 79-81, 1966.

Descriptors: *Oxygenation, *Turbulence, Mixing, Aeration, Biochemical oxygen demand, Activated sludge, Waste water treatment.
Identifiers: Specific aeration intensity, Immersion depth, Inka-aeration, Bubble-aeration.

The 'specific aeration intensity', introduced by Zahradka allows several different aeration devices with different immersion depths to be easily compared. While it is possible to get better oxygenation efficiencies at higher aeration intensities, this is not always the case. To achieve an effluent quality of 25 mg/l BOD5, the oxygenation capacity should range from 2-3 Kg O2/day/cubic meter, and 3-5 Kg O2/day/cubic meter for partial treatment. Table I shows average values obtained from a series of tests at Hamburg 1964-1965. At present, there is no common denominator for comparison of wideband and furrow aeration with surface aerators. The energy input related to one cubic meter of aeration tank for one hour is proposed as such a yardstick. Turbulence should be considered as a factor along with but not totally in place of aeration time and sludge loading factors. While turbulence is a significant factor, it is of no greater importance than the conventionally accepted parameters. (See also W71-04713). (Lowry-Texas)

PLANNING COOLING WATER FOR POWER STATIONS,
Central Electricity Generating Board, London (England). Station Planning Board.
K. M. Gammon.
Advances in Water Pollution Research, Fourth International Conference on Water Pollution Research, Prague, Czechoslavakia, p 927-936, April 21-25, 1969. 4 fig, 3 tab, 6 ref.

Descriptors: *Cooling water, *Cooling towers, *Power stations, *Thermal pollution, Cooling, Heated water, Evaporation.
Identifiers: *Great Britain, *Thames, Salt scaling, Purge discharge.

Water is required to make up evaporation and purge. The amount of purge is related to the nature of the source and to the treatment given. Analysis on inland wet tower cooled stations abstracting fresh water and discharging to rivers, and direct cooled stations on tidal waters taking and returning much greater volumes of brackish or salt water are presented in this paper. Chemical changes in water used for cooling and complex. Investigations show purge discharges to be well aerated with more concentrated salts in solutions and some heat added. With cooling towers heat is lost to the atmosphere by evaporating about 1% of the water circulated in the cooling water system. Salts in solution are progressively concentrated by this evaporation and will eventually lead to deposition of scale. Scaling on the river surface of condenser tubes reduces heat transfer rates, and its control is an important aspect in operation. It is stated that purge discharges can be integrated with benefit into river management schemes. Heat is the main addition to cooling water discharges. This can have both immediate and long-term effects. Care is taken to avoid rapid successive reheating of water for operational and environmental reasons. (Herrera-Vanderbilt)

EFFECTS OF AXIAL DISPERSION ON THE OPTIMAL DESIGN OF THE ACTIVATED SLUDGE PROCESS,
Kansas State Univ., Manhattan. Dept. of Chemical Engineering.
L. T. Fan, G. K. C. Chen, L. E. Erickson, and M. Naito.
Water Research, Vol 3, No 4, p 271-284, April 1970. 14 p, 7 fig, 19 ref.

Descriptors: *Optimization, *Activated sludge, *Aeration, *Mathematical models, Costs, Organic wastes.
Identifiers: *Axial dispersion, Pattern search technique.

The axial dispersion (longitudinal mixing) which occurs in the aeration chamber of the activated sludge system was investigated to determine the effects of axial dispersion on system performance. A so-called diffusion model was employed to characterize the flow in the aeration chamber. A pattern search technique in conjunction with the quasilinearization technique for solving the split boundary value problem of the nonlinear differential equation was used to determine the optimum design of the system. Two economic models, the overall size (total volume) of the aeration chamber and clarifier, and the total construction cost based on Smith's correlation for unit costs of subunits of the activated sludge process, were optimized and the results were compared. This analysis showed that the Peclet number, which indicated the extent of longitudinal fluid mixing or dispersion in the aeration chamber, and the feed concentration of organic sewage are two important parameters which affect optimum design of activated sludge systems. Longitudinal mixing appeared undesirable, especially when the feed concentration of organic sewage was large. (Kriss-Cornell)

MATHEMATICAL MODEL FOR WATER-WASTE WATER SYSTEMS,
Bechtel Corp., San Francisco, Calif. Scientific Development Dept.
Clark L. Weddle, S. K. Mukherjee, J. W. Porter, and H. P. Skarheim.
Journal American Water Works Association, Volume 62, No 12, p 769-775, December 1970. 7 p, 8 fig, 2 tab, 6 ref.

Descriptors: *Optimization, *Network design, *Mathematical models, *Waste water treatment, *Water demand, *Costs, Linear programming, Municipal water, Waste water disposal, Water supply.
Identifiers: Least-cost analysis, Out-of-kilter algorithm.

A network analysis-based model for selecting the least-cost water supply and waste water disposal system for a municipal area was developed. The basic elements considered included treatment of conventional water, seawater, and waste water, and storage and conveyance requirements. Lines or 'arcs' were assigned for each function or activity and each end of every arc was given a designation, termed a 'node'. A closed loop cycle was established by interconnecting all sources with all demands. For each arc used, a unit cost was assigned to the flow. The general purpose network program, based on an integer-linear programming method, used an out-of-kilter algorithm. To account for nonlinear cost functions and to formulate the input data correctly an iteration process was developed which used a preprocessing program and a recosting program. Model use included development of: the network, quality criteria and treatment requirements, cost information, least cost solution, and reiteration. The effects of blending conventional water sources with distilled seawater were considered. The example problem involved two municipal water demands, one industrial cooling water demand, one industrial process water demand, and one agricultural irrigation demand, and water supplies from two conventional water treatment plants and one seawater distillation plant. Input data and example solutions were given. (Kriss-Cornell)

WATER REUSE SYSTEMS ANALYSIS,
Institute for Water Resources (Army), Alexandria, Va.; and Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
A. Bruce Bishop, and David W. Hendricks.
Journal of the Sanitary Engineering Division, ASCE, Vol 97, No SA1, p 41-57, February 1971. 17 p, 3 fig, 9 tab, 10 ref, 2 append.

Descriptors: *Systems analysis, *Optimization, *Water reuse, *Costs, Transportation, Waste water treatment, Tertiary treatment, Desalination, Linear programming, Water demand, Utah.
Identifiers: *Origin-destination matrix, Salt Lake City.

A systems approach for analyzing water reuse alternatives was developed for sequential and recycle water reuse which delineated optimal allocations from each supply category to each use sector of an origin-destination matrix for minimization of costs. Three levels of treatment were included: (1) conventional primary-secondary; (2) tertiary; and (3) desalting. A classical transportation algorithm, using linear programming was adapted to include unit cost of delivering water having a specified quality from each origin to each destination. Treatment cost, as well as the transport cost, was included. A case study of the agro-urban-industrial region of the Salt Lake City area demonstrated an application of the model to a specific metropolitan area. Least cost results for levels of demand for the years 1965, 1980, 2000, and 2020 showed a changing pattern of allocation. The model showed that for 1965, surface and groundwater supplies were sent directly to user destinations, with effluents to system outflow; by 1980 tertiary treatment enters the picture; and by 2020 desalting, and surface and groundwater blending with output from tertiary treatment and desalting plants becomes important. Identifiers: *Glucose, *Galactose, *Monod growth kinetic model.

The objectives of the research was to delineate the roles of biochemical, physiological and physical factors in the causation of phasic uptake of organic nutrients in waste stabilization systems and to formulate basic kinetic models for predicting biomass production and the uptake rates of component substrates from mixtures. The research was performed in a chemostat type reactor using influents which contained glucose and galactose as the competing substrates. Results of continuous culture studies using heterogeneous aerobic cultures showed that the rates of biomass production and of assimilation of individual substrates were controlled by that substrate which allowed the highest growth yield and permitted the maximum specific growth rate when presented as the sole carbon and energy source. Changes in dilution rates induced concomitant changes in the physiological character of the dominant reactor population, and this phenomenon played an important role in causing concurrent assimilation of competing substrates in completely mixed continuous flow processes. In batch or plug flow reactors the utilization pattern may be concurrent or sequential depending on the physiologic character of the seed population employed and the initial concentration ratio of substrates. Equations were presented for describing the courses of eliminations of component substrates and biomass production in completely mixed or continuous flow processes. (Conway-Georgia Tech)

The main objections to the discharge of untrea
sewage to the sea are raised on aesthetic and m
cal grounds. Aesthetic objections are often
founded and can be overcome by suitable scre
ing or disintegration of the sewage bef
discharge. The medical problems arising out
marine discharge are quite insignificant and the
jections and standards are based primarily on
possibility rather than the probability of contac
enteric disease. There appears to be no need f
standard based epidemiological evidence as a s
dard based on aesthetics would suffice. Howe
shell-fisheries have special needs for unpollu
waters for public health reasons and because t
ecology is easily damaged. An open discussion
delegates is included. (Ellis-Texas)

LINEAR PROGRAMMING APPLIED TO MULTI-STAGE CAPACITY EXPANSION OF WATER TREATMENT-DISTRIBUTION SYSTEM,
Illinois Univ., Urbana. Dept. of Business Administration.
Hirohide Hinomoto.
A paper presented at the 38th National ORSA Meeting, October 28, 1970. 32 p, 3 fig, 3 tab, 17 ref.

Descriptors: *Water supply, *Water requirements, *Water demand, *Water distribution, *Municipal water, *Linear programming, Capital costs, Operating costs, Illinois, Mathematical models, Water treatment, Distribution systems, Treatment facilities.
Identifiers: *Facilities expansion.

An optimal plan was developed for expanding the capacity of municipal water treatment-distribution systems. Linear programming is applied to the multi-stage capacity expansion of a municipal water treatment-distribution system in order to determine the required sizes of new treatment plants and distribution reservoirs and the times at which they should be added to the system. The capital and operating costs of each type of facility are represented by exponential functions in concave form showing economies of scale available with an increase in capacity. Linear functions in polygonal form approximate each nonlinear cost function, thereby transforming the original nonlinear formulation to a linear program. For illustration, the linear program formulated is applied to the water supply system serving the twin city of Champaign-Urbana, Illinois, and its vicinity under assumed conditions approximating the real situations. The system obtains water from practically unlimited under-ground sources. Finally, the usefulness of the model depends much on the availability of reliable information on future demands and the capital and operating cost functions related to the types of facilities considered. Since most cost data available in published studies are not useful for the present model, the collection of reliable current data for determining cost functions usually is prerequisite to the successful application of this model. 5G. Water Quality Control

VESSEL POLLUTION CONTROL.
Federal Water Quality Administration, Edison, N.J. Water Quality Lab.

Federal Water Quality Administration, Edison Water Quality Lab Research Newsletter, Vol 1, December 1970. 12 p.

Descriptors: *Recreation wastes, *Water pollution sources, *Boating, *Water pollution control, Sewage, Waste water (Pollution), Projects, Sanitary engineering.
Identifiers: *Boating wastes, Outboard motor wastes.

This report describes on-going and completed FWQA research development and demonstration projects for controlling waste pollution from watercraft, outlines the problem of pollution from outboard motors, discusses water quality standards for vessels; and details proposed research and development needs for controlling vessel pollution. This can be accomplished through grants, contracts, and in-house efforts. The many watercraft of all classes which use American waters are capable of utilizing the water resources in any of our 50 states and can deposit varying amounts of wastes at any location causing localized pollution. It is estimated that the total daily waste discharged from all watercraft approximates the wastes from a city of one-half million people. (Knapp-USGS)

Cornell Univ., Ithaca, N.Y. Dept. of Water Resources Engineering.
Yu-Leuk Choi.
Journal of the Hydraulics Division, Proceedings of the ASCE, Vol 96, No HY10, p 2154-2158, October 1970. 1 fig, 1 ref.

Descriptors: Reservoirs, Thermal stratification, Model studies, Temperature.
Identifiers: *Temperature variations, Effective diffusivity.

The essential features of the model described are the methods used to allow for advection and convective mixing at the water surface. It is assumed that density is a monotone decreasing function of temperature in the range considered. Some assumptions are used, such are: all horizontal planes are isotherms within the region of water impoundment, inflow enters the system at the elevation where the resident water has the same temperature; outflow rate at any elevation is equal to the withdrawal rate at that elevation. Both inflow and outflow are algebraically additive in the upward vertical direction. These specify the pattern of total vertical flow in the reservoir. These also complete the one-dimensionality of the system and leads to the simplification that temperature distribution is describable by considering only the conservation of mass and heat energy. Identifiers: *Oxygen balance.

The aim of this study was to determine the role of algae in biodegradation of organic wastes and self-purification of streams. The monitoring of the system in a laboratory stream microcosm was accomplished by determination of dissolved oxygen, pH, and bicarbonate-carbonate alkalinity. The results indicated a lesser constancy of production process in comparison with that of respiration. The carbon:oxygen ratio was influenced by the age of algal cells. The oxidation of organic substances occurred during periods of darkness. Photosynthetic production was limited by the available carbon dioxide. The contribution of algae to selfpurification of water appeared to be very low. The determination of photosynthetically produced oxygen could not be reliably accomplished before the synthesized material had been oxidized. (Wilde-Wisconsin)

EFFECT OF ENVIRONMENTAL FACTORS ON BENTHAL OXYGEN DEMAND,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
S. Douglas Hall.
MS thesis, 1966. 60 p, 11 fig, 5 tab, 25 ref, append. OWRR Project A-003-PA (1).

Descriptors: *Benthos, *Decomposing organic matter, *Streams, *Bottom sediments, Aerobic conditions, Anaerobic conditions, Oxygen demand, Respiration, Mathematical studies.
Identifiers: Oxygen concentration, Slab Cabin Run (Pa).

Benthal aerobic-anaerobic decomposition in the ecto- endo-zones of bottom sediments are described. The study was conducted in a laboratory reaction chamber using benthos samples collected from a small stream. A decrease in oxygen concentration of supernatant water was paralleled by a lower rate of oxygen demand of benthal material, although the latter slightly increased with the depth of the benthos. The rate of oxygen concentration and utilization was controlled by the invertebrate:bacteria respiration ratio. The respiration of macroinvertebrates accounted for 40 to 60% of the total OD. The total respiration of the benthal layer investigated was expressed by an empirical equation incorporating bacterial respiration, the number of invertebrates, and oxygen concentration at 20C. A REVIEW OF HERBIVOROUS FISH FOR WEED CONTROL,
Bureau of Sport Fisheries and Wildlife, Warm Springs, Ga. Southeastern Fish Control Lab.
Joe B. Sills.
The Progressive Fish-Culturist, Vol 32, No 3, p 158-161, 1970. 12 ref.

Descriptors: *Fish, *Herbivores, *Aquatic weed control, Tilapia, Carp, Algae, Rooted aquatic plants, Plankton, Arkansas, Insects, Turbidity, Chara, Pondweeds.
Identifiers: Tilapia nilotica, Tilapia mossambica, Tilapia melanopleura, Cyprinus carpio, Ctenopharyngodon idellus.

There is growing interest in biological pest control as a substitute for pesticides. Fish receiving most attention for aquatic weed control possibilities are Tilapia nilotica, T mossambica, and T melanopleura; the Israeli strain of carp (Cyprinus carpio); and the Chinese or grass carp (Ctenopharyngodon idellus). Results obtained with each are reviewed. All tests in which Tilapia were stocked in ponds resulted in overcrowded populations and unsatisfactory weed control. Although the carp is effective in reducing or controlling aquatic plants, detrimental aspects of its presence make its usage undesirable in recreation and fishing waters. Tests showed that the Israeli strain is not primarily herbivorous, but roots in the bottom much as wild carp do. Observations are continued to learn why the Israeli strain does not reproduce in ponds with mixed populations. All observations to date on the grass carp are most favorable. It does feed on aquatic vegetation. There is no indication of natural reproduction, but the fish can be spawned. As its native habitat is similar to some of our large river systems, the grass carp may adapt to them. More information is needed for its use except in strictly controlled environments. FEASIBILITY STUDY MANUAL - MINE WATER POLLUTION CONTROL DEMONSTRATIONS.
NUS Corp., Pittsburgh, Pa. Cyrus Wm. Rice Div.

For sale by Superintendent of Documents U.S. Government Printing Office, Wash, D.C. 20402, I67.13/4:14010FLW $0.65. Microfiche from NTIS as PB-197 594, $0.95. Water Pollution Control Research Series 14010 FLW 07/70, June 1970. 65 p, 2 fig, 3 ref, 4 append. FWQA Program 14010 FLW.

Descriptors: *Acid mine water, *Water pollution control, *Feasibility, *Project feasibility, *Feasibility studies, Project planning, Federal project policy, Optimum development plans, Programs, Project purposes, Water pollution treatment, Abatement.
Identifiers: *Mine drainage abatement.

This manual is to be used as a guide by State or interstate agencies in uniformly performing feasibility studies for projects proposed to demonstrate methods for the abatement of mine drainage pollution as required by Section 14 of the Federal Water Pollution Control Act as amended. The required feasibility studies are to aid the Secretary of the Interior in selecting the mine drainage pollution control method or methods suitable for demonstration, and also the optimum watershed where the effectiveness of the project will have the greatest public value or uses. Identifiers: *San Luis Drain (Calif), *San Joaq Master Drain (Calif), *Central Valley (Calif).

The programs of the United States and the State California to build San Luis Drain and San Joaq Valley master drain, and the concern for wa quality in San Francisco Bay prompted a coope tive investigation of methods for removing nitra from subsurface agricultural waste water. The vestigation broadened to include examination the source of the nitrates and the changes in nitr form which might occur spontaneously or wh might be induced as the subsurface water is lected and conveyed through California's Joaquin Valley to the head of the San Franci Bay System. The results of the investigation very briefly reviewed and presented in summary bles. (See also W71-04546) (Knapp-USGS)

Descriptors: *Simulation analysis, *Path of po tants, *Return flow, *Nitrates, Mathemati models, Computer programs, California, Wa pollution sources, Leaching, Drainage water, A monia, Drainage effects, Groundwater, Wa quality, Soil water.
Identifiers: *Groundwater pollution, *Central V ley (Calif).

A digital computer program was developed model soil-water systems with respect to nitro transformations, including hydrolysis of urea, mobilization-mineralization of ammonia and ganic nitrogen, and immobilization of nitr nitrogen. Comparisons were made of predicted observed data for several soils having different t tures and various moisture contents, temperatu and fertilizer applications. This procedure yiel simple correlation coefficients of 0.99, 0.97, 0.97 for the urea, organic, and ammo nitrogenous types. A model predicting the conc trations of nitrogenous species occurring in s water systems aids in planning management crite for pollution control and fertilizer programs. (also W71-04546) (Knapp-USGS)

HYDRAULIC PROPERTIES RELATED TO STREAM REAERATION,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
C. C. Tsivoglou, and J. R. Wallace.
Research supported by grant from Federal Water Quality Admin. In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/31, p 509-522, 1970. 14 p, 2 fig, 2 tab, 8 ref.

Descriptors: *Reaeration, *Mixing, *Turbulent flow, *Tracers, Dye releases, Radioactivity techniques, Tritium, On-site tests, Air-water interfaces, Cavitation, Turbulence, Water pollution control, Water pollution treatment, Model studies.
Identifiers: *Krypton.

Field tracer experiments were designed to investigate the relationships between the reaeration capacity of a flowing stream and the stream's hydraulic properties, to develop models for the accurate prediction of stream reaeration capacity. Accurate knowledge of stream reaeration capacity is a necessity in determining the required degree of waste treatment and the associated costs. Reaeration is a direct function of the rate of surface water replacement due to turbulent mixing. Recent development of a gaseous radiotracer technique permits field measurement of reaeration. This procedure involves the simultaneous use of three tracers, namely a fluorescent dye for time of flow, tritiated water for accurate dispersion measurement, and dissolved krypton-85 for measurement of gas transfer. Field results, obtained by this technique are highly reproducible. Field tracer studies of the reaeration capacities of three medium sized streams were conducted over a total of about forty river miles. Associated hydraulic properties such as stream flow, cross-sectional area, depth, velocity, hydraulic gradient and dispersion were also measured. Features such as waterfalls, rapids and pools are included. More than eighty observations of the reaeration capacities of individual stream reaches were made. In streams of the type studied most of the real work of gas transfer and reaeration takes place in relatively short reaches. In general, the magnitude of the gas transfer coefficient is controlled by the rate of surface water replacement and this in turn is controlled by the rate of energy expenditure, measured as the rate of loss of water surface elevation. (Knapp-USGS)

CONTROL OF SPILLAGE OF HAZARDOUS POLLUTING SUBSTANCES,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
J. W. Dawson, A. J. Shuckrow, and W. H. Swift.
Copy available from GPO Sup Doc as I 49.13/415090FOZ10/70, $3.00; microfiche from NTIS as PB-197 596, $0.95. Water Pollution Control Research Series, 15090 FOZ 10/70, Nov 1, 1970. 390 p, 28 tab, 31 fig, 105 ref, 9 append. WQA Program 15070 FOZ 10/70.

Descriptors: *Water quality, *Accidents, *Chemicals, Monitoring, *Costs, *Water pollution control, Water pollution sources, Legislation, *Chemical wastes, Chemical properties.
Identifiers: *Hazardous polluting substances, Countermeasures, *Spills, *Critical concentrations, *Enforcement, *Hazardous materials, Acute discharges, Detection.

An evaluation of the water quality aspects germane to the spillage of hazardous polluting substances is developed. Emphasis is placed on definition and classification of chemical materials; the nature of the sources of spillage and past experience; and analysis of the relative threat to water quality offered by such substances; a review of presently available detection, control, and removal technology; relationship to water quality standards; and the relevant administrative, enforcement, and cost recovery aspects. Over 800 chemical substances were evaluated as to their annual production and transport quantities, their critical concentration in the aquatic environment resulting in water quality impairment for the several beneficial water uses, detection limits (both field and laboratory), and the control and removal methods presently available or potentially practicable. Over 250 chemicals and compounds, generally those in large scale production and utilization, are priority ranked in order of relative threat to water quality in terms of annual production/sales, intrinsic hazard to water quality, transport mode, and past statistical accident frequency. Recommendations are presented regarding future research and development efforts aimed at mitigating damage and a consensus of informed parties is presented relating to the need for additional legislation. This report fulfills Contract No. 14-12-866, between the Federal Water Quality Administration and the Pacific Northwest Laboratories, Battelle Memorial Institute. The right of a citizen to bring an action to abate pollution without showing specific damage to himself ought to be granted under the Refuse Act in both State and Federal law. The qui tam theory should not be expanded. Rather, class action rights should be authorized with no monetary rewards provided to the plaintiff, other than the recovery of costs when he prevails. This is particularly true when the prosecution of hazardous polluting substances (spill cases) is so inadequate at both the State and Federal level. Any damages recovered would go into funds established to effect environmental restoration in the event cleanup or restoration at a specific spill site were impossible or undesirable.

THE FEDERATION AND PURE WATERS,
Dwight F. Metzler.
Journal, Water Pollution Control Federation, Vol 40, No 8, Part 1, p 1397-1402, Aug 1968. 6 p, 1 tab.

Descriptors: *Pollution abatement, *Water pollution control, *Administrative agencies, *Personnel, Water quality control, Federal government, Public health, Grants, Manpower, Training, Waste water disposal, Waste water (Pollution), Planning, Administration, Operation and maintenance, Financing, Costs, Public utilities, Education, Social aspects.

The Water Pollution Control Federation has done much to focus public concern on water pollution abatement. Its member associations such as the New York State Water Pollution Control Association have made important contributions. The New York Pure Waters Authority has been created to assist the Pure Waters program by construction of waste water facilities and technical assistance for operation of the facilities on a community level. The program needs to place more emphasis on the recruitment of competent personnel by offering attractive salaries, upgrading the public image of such employment, and promoting of training--especially in the management and supervision areas. The Federation should set up procedure and facilities for a sustained recruitment. Technical training for better plant operation, which is of paramount importance, can be improved by supplementing state training programs. The seminar-workshop approach by state associations can be utilized to put objectives into practice. There is a need for better communication between the Federation members and the public. TEMPERATURE CONTROL ENHANCES NATURAL BENEFICATION OF COAL MINE DRAINAGE,
Cornell Univ., Ithaca, N.Y.
R. Lachman.
International Congress on Industrial Waste Water, Stockholm, Sweden, Typescript. 12 p, 1 fig, 5 tab, 9 ref.

Descriptors: *Coal mine wastes, *Temperature, Pyrite, Oxidation, Neutralization, Iron, Alkaline water, Impoundments, *Mine drainage.
Identifiers: Natural benefication.

Although it is impossible to say that there is any one key factor in the benefication of coal mine effluents, a major factor was found to be the complex interrelationship of effluent, air, and receiving water temperatures. The acid effluents discharged from coal mines are produced as the result of the oxidation of pyritic materials to either ferrous or ferric sulfate followed by the leaching of these products into streams. The field experiment consisted of the construction of small impoundment dam in which benefication resulting from the controlled mixing of mine and surface waters could be studied under natural environmental conditions. The criteria used for determining that benefication had occurred were changes in acidity, ferrous iron, total iron, aluminum, calcium, magnesium and sulfate content of the mixture while the acidity, ferrous iron, total iron, aluminum, and sulfate are decreasing, the calcium and magnesium remain virtually unchanged. All of the six tests performed show that the highest percent reductions in iron were obtained when the stream and effluent temperature differences were smallest. (Upadhyaya-Vanderbilt)

ENERGY PRODUCTION - A WORLD LIMIT,
Cambridge Univ. (England). Cavendish Lab.
P. F. Chapman.
New Scientist, p 634-636, September 24, 1970. 1 fig, 1 tab.

Descriptors: *Solar radiation, *Thermal pollution, Energy budget, Forecasting, Water pollution control.
Identifiers: *Energy sources, Energy production, Surface temperature, Power input.

Estimates of the total solar energy incident on the Earth fall in the range of 1.49 x 10 to the 18th power to 1.55 x 10 to the 18th power kilowatt-hours per annum. Using the value of 280 K for the surface temperature of earth, it follows from Boltzman's Law that a one percent rise in the power input corresponds to a temperature rise of 0.7K. It is proposed that energy production should be restricted to be less than 5 percent of the total solar input. This limit corresponds to a temperature rise of 3.5 K. The maximum world hydroelectric power capacity, estimated in 1960 on the minimum flow rate of the world's major river systems, it only 0.05 percent of energy incident on the oceans. If we are to avoid increasing Earth's surface temperature by an appreciable amount, then the present trend in world energy production must soon change. In order to obtain more energy without displacing the temperature equilibrium further the equilibrium sources must be utilized. It has been estimated that present technology may be able to extract one percent of the solar radiation. Acceptance of any limit to the world's energy production implies a maximum world population. (Upadhyaya-Vanderbilt)

USEFUL ENERGY FROM UNWANTED HEAT,
WAPORA, Inc., Rockville, Md.
J. I. Bregman.
Chemical Engineering, p 83-87, January 25, 1971. 4 tab.

Descriptors: *Cooling water, *Thermal pollution, Cooling towers, Costs, Standards, Water pollution control.
Identifiers: *Waste heat, *Once-through cooling, Cooling ponds, Drift loss, Aquaculture.

Once through cooling is certainly the most economical way of accomplishing heat dissipation. The results of a study conducted by Federal Power Commission show that about 71 stations in the 1,000 to 4,000 Mw range are capable of being supported by reservoirs, 24 in the 4,000 to 12,000 Mw range, and 8 at 12,000 Mw or greater. Efficiency of a cooling pond may be increased markedly by introducing a spray into the system. Common problems connected with large cooling waters includes wood deterioration, biological fouling, the formation of deposits, corrosion and scaling. Another major problem is drift and togging. A typical tower with a flow of 250,000 gal. per minute operating on seawater with a salinity of 35,000 ppm, and a drift loss of 0.1 percent will emit about 4,400 lb. per hour of sodium chloride. Costs for dry tower runs from $25 to $30 per Kw., compared to $8 to $13 per Kw. for wet towers. Cooling water from a nuclear power plant may be particularly suited to aquaculture. Possibility of placing a chemical plant next to a nuclear plant appears attractive. It is concluded that potential does exist for turning waste heat into a useful commodity. (Upadhyaya-Vanderbilt)
W71-04728

PLASTIC COOLING TOWER SAVES SPACE AND WEIGHT.
Whirlcool, Inc., Franklin Lakes, N.J.

Chemical Engineering, p 48, January 25, 1971. 1 fig.

Descriptors: *Cooling towers, Maintenance, Water loss, Corrosion, Water pollution control.
Identifiers: *Plastic cooling tower, Polyethylene.

Smaller than conventional cooling towers, and wighing 1/7th that of wood or steel construction, this model offers design engineers more leeway in installing cooling towers in tight spaces or on soft foundations. Other features are long, maintenance free service and minimum corrosion problems. The tower is fabricated from a large, one-piece seamless tubular shell of high density polyethylene that is highly resistant to acids, alkalis and salts, as well as algal growth. The units are available in models ranging in capacity from 150 to 600 gpm. Up to 5000 gpm capacity can be installed using a modular arrangement of successive towers. The internal design, or spiral/step flow arrangement, causes air and water to contact countercurrently while swirling around within spiral channels. Water loss, through carryover and drift, is kept low. (Upadhyaya-Vanderbilt)
W71-04729

ECONOMICS OF THERMAL POLLUTION CONTROL,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
G. O.G. Lof, and J. C. Ward.
Journal Water Pollution Control Federation, Vol 42, No 12, p 2102-2116, December 1970. 5 fig, 3 tab, 16 ref.

Descriptors: *Thermal pollution, *Thermal powerplants, Economics, Cooling water, Efficiencies, Temperature, Evaporation, Ecology, Costs, Cooling towers, Water pollution control.
Identifiers: Recirculation cooling, Once-through cooling.

Approximately 80 percent of all water used by industry is used for cooling purposes. Plots are given showing the estimated cooling water withdrawal to the year 1980 and for estimates of past and future recirculation. If the cost of supplying cooling water in a once through system, including withdrawal, pumpage, and treatment if necessary, exceeds about $0.01/1000 gallon (0.3 mill/KWH generated in fossil fuel plants) recirculation cooling would usually be employed. On-site cost would be minimized by such decision. Regulations prohibiting unlimited thermal discharge is the other reason for using recirculation cooling. Equations are given for calculating annual investment expense and operating cost for recirculation cooling using a forced-draft cooling tower. The results of a downstream powerplant using warmer condenser water than would naturally have been available are a decrease in total electric generation and a decrease in thermal efficiency, hence, an increase in cost per kilowatt hour. Thermal discharge has the effect of diminishing downstream flows and lake volumes just as does recirculation cooling to avoid thermal discharge. (Upadhyaya-Vanderbilt)

POLLUTION CHARGES INCOME AND THE COSTS OF WATER QUALITY MANAGEMENT,
Ohio State Univ., Columbus. Dept. of Economics.
J. H. Boyd.
Water Resources Research Center, Ohio State University, Columbus, Ohio, 1970. 28 p, 2 tab, 3 fig, 15 ref. OWRR Project A-010-Ohio (2).

Descriptors: *Water quality, *Water pollution effects, *Water pollution control, Biochemical oxygen demand, Flow augmentation.
Identifiers: *Effluent charges, Instream aeration.

Polluters should realize the marginal opportunity costs of utilizing rivers for waste disposal, equal to the marginal value of downstream water quality foregone. The author considers that 'pollution charges' (usually called effluent charges) represent a portion of the economic rent of the river, and that additional charges on enjoyers of water quality would be another portion of the economic rent desirable from an equity view point. Investments in facilities to increase the river's assimilative capacity such as instream aeration are costs to the river authority. The author discusses financial balance and Pareto efficiency as important to public policy. Discussion is presented which indicates that an optimizing river authority is apt to have surplus revenues. Section II of the paper examines the relationship between pollution charges income and assimilative capacity augmentation costs for a case of one upstream polluter and one downstrea beneficiary. Section III discusses relationshi between pollution, water quality and low flow au mentation and Section IV extends the model more than one polluter and one beneficiary. (T model assumes ability to evaluate water quali benefits.) (Whipple-Rutgers)

Identifiers: *Water resources planning, Wate supply systems, Environmental policy, Environ mental quality, Environmental problems.

Years ago it was recognized that piecemeal approaches to water resources development were wasteful and ineffective. To combat this approach the Water Resources Planning Act was passed in 1965. Now that act should be reconsidered--updated with new approaches for dealing with mercury, DDT, and municipal water supplies. Resource development agencies must see the urban region as a necessary unit of action in planning. Specific measures to be taken in the 1970's include: 1) removal of gross pollution from municipal and industrial outlets, 2) use of advanced waste treatment technology, 3) demonstration of regional control of pollution, 4) reduction of DDT, other pesticides, and detergents, 5) reduction in rate of deterioration of Great Lakes, 6) management of waste heat from industry, 7) improved control over oil production and transportation. In order to achieve these goals, the following suggestions are made. The federal government should enforce pollution control in all navigable waters. Also the federal construction grant allocation procedure should be extensively revised. To facilitate innovation, a series of regional water quality management studies ought to be initiated as demonstration projects. The collection of detailed information with sources of polluters identified should be authorized in order to effectively plan a pollution control program. The water supply and waste water utility services of local government should undergo a program of reorientation, and a national program of technology assessment ought to be established to insure the minimization of consequences harmful to life as a result of new materials or machines. THE CONTROL OF POLLUTION BY OIL UNDER THE WATER QUALITY IMPROVEMENT ACT OF 1970,
Washington and Lee Univ., Lexington, Va. School of Law.
James S. Dix, and Aron L. Suna.
Washington and Lee Law Review, Vol 27, p 278-303, 1970. 11 p, 51 ref.

Descriptors: *Oil, *Water quality control, *Water Quality Act, *Water pollution, Water pollution sources, Oily water, Water pollution effects, Water pollution control, Federal government, Legislation, Pollution abatement, United States, Oil industry, Coastal structures.
Identifiers: *Water Quality Improvement Act of 1970.

In recent years extensive damage has resulted from the increased utilization of oil in our society. Through spillage and the proliferation of offshore drilling, oil pollution of our waters has become a major problem. The Water Quality Improvement Act of 1970 is an attempt to police and alleviate oil pollution by enabling the government to recover cleanup costs from the polluter. The authors herein delineate the scope, relate the legislative history, and hypothesize as to the application of the liability provisions of the Act. The provisions of the Act are discussed, and a chart is presented summarizing exceptions to the applicability of the Act. The chart sets out limits of liability, designating where unlimited liability is applicable. The provisions of the Act are critically analyzed and suggestions for improvement are included. TURBULENT DIFFUSION AND ENTRAINMENT IN TWO-LAYER FLOW,
Norges Tekniske Hoegskole, Trondheim. River and Harbor Lab.
T. Carstens.
Proceeding, American Society of Civil Engineers, Journal of Waterways and Harbors Division, 96 (WWL) p 97-104, February 1970. 7 fig, 1 tab, 8 ref.

Descriptors: *Estuaries, *Flow control, *Turbulent flow, *Diffusion, *Entrainment, Salinity, Tracers, Sea water, *Path of pollutant, Water pollution control, Flow.

A freshwater layer over a pool of seawater may extract salt by diffusion and entrainment. Diffusion is a two-way transport with equal volumes exchanging places, entrainment is a one-way advectival type of transport. The rates of the two vertical transports depend on the turbulence in the surface layer and in the pool. The more turbulent water mass will erode and entrain the less turbulent one. The distribution of salinity in an estuary is helpful in the location of freshwater intakes and can be used as a tracer to estimate transport rates of other flow pollutants. (Ensign-PAI)

CONTROLLING OIL POLLUTION OF HARBORS THROUGH BIOLOGICAL MEANS.
Naval Research Reviews, Vol 23, No 5, p 24-26, May 1970. 1 fig.

Descriptors: *Water pollution control, *Oil, *Cleaning, *Biodegradation, *Fertilization, Nitrogen, Phosphorus, Microorganisms, Self-purification, Oil wastes.
Identifiers: Accelerated biodegradation, *Oil pollution.

The U. S. Navy has begun a research program for better methods of controlling oil pollution of harbors and beaches. The program will concentrate on decomposition of oil through natural processes. Biodegradation of the oil is the most significant self-purification process active in the oceans. The study, conducted by Rutgers University, is to find ways to speed up biodegradation. Seeding dispersants with cultures of oil-degrading microorganisms may accelerate biodegradation. Ways of fertilizing with mineral nutrients such as nitrogen and phosphorus are being studied and offer extensive laboratory experiments. Field tests will be made on shores and estuaries in New Jersey. (Ensign-PAI)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

A MODEL FOR CAPACITY EXPANSION PLANNING OF WATER DISTRIBUTION NETWORKS,
Massachusetts Inst. of Tech., Cambridge. Ralph M. Parsons Lab. for Water Resources and Hydrodynamics; and Massachusetts Univ., Amherst Dept. of Civil Engineering.
Fu-Hsiung Lai, and John C. Schaake, Jr.
Available fron NTIS as PB-197 557, $3.00 in paper copy, $0.95 in microfiche. Massachusetts Institute of Technology, (MIT), Ralph M. Parsons Lab for Water Resources and Hydrodynamics Report No 131, October 1970. 234 p, 54 fig, 22 tab, 71 ref, append. OWRR Project No B-014-MASS (1).

Descriptors: *Systems analysis, *Optimization, *Mathematical models, *Water distribution (Applied), *Network design, Distribution systems, Public utilities, Water demand, Water delivery, Water management (Applied), Water supply, Dynamic programming, Computer programs.
Identifiers: *Water system expansion.

Methodology was developed for planning the capacity expansion of water distribution networks to meet anticipated future water needs. Optimal present investment decisions could be related to the annual discount rate, economy-of-scale in the cost of capacity expansion, existing network capacity, and the demand growth patterns. The general nature of water distribution network planning and the problem of single period planning for a tree network were reviewed. Dynamic programming was applied to the problem of multiperiod, single component planning. A model was developed for tree network planning. (Knapp-USGS)

SIMULATION OF BIOLOGICAL PROCESSES BY ANALOG AND DIGITAL COMPUTERS,
Kansas State Univ., Manhattan. Inst. for Systems Design and Optimization.
L. T. Fan, P. S. Shah, and L. E. Erickson.
Institute for Systems Design and Optimization, Report No 20, July 1970. 120 p, 39 fig, 5 tab, 41 ref, 2 append. OWRR Project A-019-KAN (2).

Descriptors: *Analog computers, *Digital computers, Simulation analysis, *Biological treatment, Waste treatment, Flow.

In the first part of this report the analog computer, its basic components and their functions were reviewed and discussed. The state variable approach was used for the analog computer programming to solve the higher order differential equations. Suggestions were made for drawing an analog circuit diagram by dividing it into subdiagrams which were classified as the main subrouting, special function subroutine and the memory subroutine. The analog computer simulation was illustrated by the biological wastetreatment processes. The transient behavior of the system was observed for constant influent organic concentration and for constant influent flow rate during the start-up or restarting of the plant. Phase-plan plots for different flow rates were also obtained. The transient behavior of this system was observed for a cyclic influent flow rate. The second part of the report contained a general description of the continuous system modeling program for the simulation of the continuous system. The detail programming information and a description of the inputs and outputs was given. The simulation by digital computer was illustrated by simulating the batch kinetics for the growth of microorganisms on hydrocarbon substrate (a four phase reacting system). The effect of cell adsorption to the surface of the dispersed phase, substrate transport between phases, phase equilibrium and growth kinetics could be considered using this model. (Kriss-Cornell)

EFFICIENCY AND EQUITY IN THE OPTIMAL SUPPLY OF A PUBLIC GOOD,
Maryland Univ., College Park.
Martin C. McGuire, and Henry Aaron.
Review of Economics and Statistics, Vol LI, No 1, p 31-39, February 1969.

Descriptors: *Economic efficiency, *Welfare economics, *Economic evaluation, Costs, Benefits, Taxes, Government, Marginal cost, Income, Mathematical study, Decision-making, Optimization, Maximization.
Identifiers: *Lendahl solution, *Pareto efficiency, *Public goods, Marginal utility, Income transfers, Marginal rate of substitution.

The Lindahl voluntary exchange decision rule, which leaves the initial income distribution unchanged makes possible the separation of decision rules for allocative efficiency and distributional equity in relation to a public good. This can be demonstrated from the following: (1) the marginal costs of production need not equal the sum of the individuals marginal rates of substitution; (2) with either direct lump sum income transfers or variable cost sharing tax burdens, the choice of a final utility distribution dictates a unique Pareto optimal public goods supply decision; (3) if both tax shares are variable and lump sum income transfers are allowed then the optimal utility distribution is Pareto-efficient and can be achieved through a Lindahl solution to the public good supply problem. These propositions are demonstrated both diagramatically and mathematically. The author summarizes the implications for the theory of taxation and expenditure. The conclusions of this paper would indicate a distinct method of cost allocation and benefit distribution for water resources projects and is therefore relevant to the water resources economist. UNCERTAINTY AND THE NEED FOR COLLECTIVE ACTION,
Harvard Univ., Cambridge, Mass.
Richard Zeckhauser.
In: Public Expenditures and Policy Analysis, 1970, 96-116.

Descriptors: *Uncertainty, Economic evaluation, *Government, Optimization, Demand, Risk, Insurance, Flood control, Forecasting, Probability, Benefits, Capital, Income, Taxes, Marginal costs.
Identifiers: *Contingent claims, *PIP goods, *Individual preferences, Equity considerations.

The author believes that the expansion of knowledge on the subject of uncertainty has not stressed the role of the government. This paper attempts to show that the presence of uncertainty creates special obligations and possibilities for collective or governmental action. The author first considers those situations in which individuals who are unable to predict their individual portions of future total demand may find it useful to make some decisions on the collective provision of a good before preferences become known. There is a discussion of the factors which make it advantageous to provide goods, for which accurate provision of future preferences is impossible, on a collective basis. The paper also evaluates the effect of trades in contingent goods having a risk-sharing objective on incentives for individual effort. The government's attitude towards risk is examined and, in the concluding section, the effect of possible governmental action on expectations is evaluated. Uncertainty is a problem in water resource analysis, as evidenced by the author's numerous references to flood control programs and this paper represents a useful source for information concerning the potential issues of uncertainty in the water resource area. NUMERICAL SIMULATION OF DISPERSION IN GROUNDWATER AQUIFERS,
Colorado State Univ., Fort Collins. Dept. o Agricultural Engineering; and Colorado Stat Univ., Fort Collins. Dept. of Civil Engineering.
Donald Lee Reddell, and Daniel K. Sunada.
Colorado State University Hydrology Paper No 41 June 1970. 79 p, 35 fig, 1 tab, 96 ref, 8 append OWRR Project A-001-COLO (8).

Descriptors: *Simulation analysis, *Dispersion *Groundwater movement, *Numerical analysis Mixing, Computer programs, Computer models Mathematical models, Saline water intrusion Aquifers, Porous media, Diffusion, Convection Diffusivity.
Identifiers: Longitudinal dispersion.

A flow equation for a mixture of miscible fluids wa derived by combining the law of conservation o mass, Darcy's law, and an equation of state describing the pressure-volume-temperature-concentration relationship. The result is an equation involving two dependent variables, pressure and concentration. A relationship for determining concentration was derived by expressing a continuity equation for the dispersed tracer. An implicit numerical technique was used to solve the flow equation for pressure, and the method of characteristics with a tensor transformation was used to solve the convective-dispersion equation. The results from the flow equation were used in solving the convective-dispersion equation and the results from the convective-dispersion equation were then used to resolve the flow equation. The computer simulator successfully solved the longitudinal dispersion problem and the longitudinal and lateral dispersion problem. Using the tensor transformation, problems of longitudinal and lateral dispersion were successfully solved in a rotated coordinate system. The computer simulator was used to solve the salt-water intrusion problem. The numerical results for the fresh water head in the aquifer closely matched those obtained analytically. TOOLS FOR WATER RESOURCE STUDY,
Illinois State Water Survey, Urbana.
Julius H. Dawes.
ASCE Annual and Environmental Meeting, Chicago, October 13-17, 1969. Meeting Preprint 1074. 43 p, 18 fig, 3 tab, 10 ref.

Descriptors: *Planning, *Water resources development, *Water utilization, *Administration, *Mathematical models, *Water costs, Reservoir design, Pumping, Conveyance, Sewage treatment, Wells, Pumps, Analytical techniques, Illinois.

The Illinois Water Survey determined that a need exists for a series of water resource models--describing development, use and management functions. Studies were initiated on the cost and benefit of various elements of water resource development. Some of the studies completed are as follows: costs of reservoirs in Illinois, costs of wells and pumps, water transmission costs, costs of pumping water, and cost of sewage treatment. It is necessary to develop working tools in order to progress in the creation of a water resource use, development and management model. It is in-

led that these tools be used as a basis for comson between alternatives. The results will have same degree of certainty as incorporated in the c cost data. Cost estimates derived by these niques should not take the place of detailed nates prepared by engineers for specific condis. Cost estimates for reservoirs, wells and ps, transmission lines, pumping water, water ment, and sewage treatment will be helpful in ng quality, quantity and economic parameters e physical system. Through their application, it ld be possible to examine the alternative solu- to meet the objective determined by omic, social and political criteria. (Poertner)

SYSTEMS ANALYSIS FOR URBAN WATER MANAGEMENT,
Water Resources Engineers, Inc., Walnut Creek, Calif.

Available from NTIS as PB-197 677, $3.00 in paper copy, $0.95 in microfiche. Completion Report, September 1970. 78 p, 12 fig, 9 tab, 46 ref, 1 append. OWRR Project C-1536 (No 1992) (4).

Descriptors: *Systems analysis, *Water management (Applied), *Simulation analysis, *Mathematical models, Storm runoff, Municipal water, Economics, Cities, Urbanization.

The major purpose of this study was to indicate that the goals of urban water management, with respect to the use and further development systems analysis tools explored, are attainable. It was primarily a technicalenterprise to demonstrate that a comprehensive model could be constructed in a general enough format to allow its application to many urban water systems while at the same time urban water subsystem submodels, comprising the larger model, could be operated independently to describe behavior of specific urban susbystems. Economic aspects were also considered. A comprehensive simulation model was developed for a specific hypothetical Urban Water Resources System structured to indicate the interrelationships among inflows, storage volumes, outflows, and qualities in various subsystems. A more expensive but more refined storm water modeling project was described. An economic systems model was formulated to evaluate physical works projects intended to meet urban water objectives subject to technical and budgetary constraints. Results of the hypothetical demonstrations of the technical and economic models were given. Major conclusions and recommendations were presented. (Kriss-Cornell)

SYSTEMS ANALYSIS FOR GREAT LAKES WATER RESOURCES.
Ohio State Univ., Columbus. Water Resources Center.

Available from NTIS as PB-197 678, $3.00 in paper copy, $0.95 in microfiche. Proceedings of the Fourth Symposium on Water Resources Research of the Ohio State University, Water Resources Center, October 1969. 135 p, 10 fig, 18 tab, 52 ref, 2 append. OWRR Project A-999-OHIO (3).

Descriptors: *Systems analysis, *Water resources development, *Optimization, *Great Lakes, Pollution abatement, Economics, Ohio, Water pollution control.

The Symposium was an outgrowth of interest in pollution abatement measures for the Great Lakes. It represented an effort to resolve the optimum approach to be taken in the solution of water problems. Section I dealt with the biological-chemical-physical subsystem and included development of a comprehensive simulation model of the fish resources of the Great Lakes, microbial-chemical interactions as systems parameters for Lake Erie, an oxygen-based performance model for Western Lake Erie, and preliminary policy models for Great Lakes regulation. The economic subsystem was dealt with in Section II which described an interindustry forecasting model with water quality and quality constraints, some determinants of Detroit's regional share of economic activity in selected industries, a regional trade and structure model for pollution abatement in the Western basin of Lake Erie. Section III entitled 'Integration of the Model' included the topics of the utility of systems analysis in estuarine water quality management, and systems analysis, water quality and government decision making. DEVELOPMENT OF A COMPREHENSIVE SIMULATION MODEL OF THE FISH RESOURCES OF THE GREAT LAKES,
Washington Univ., Seattle, Center for Quantitative Science in Forestry, Fisheries and Wildlife.
Gerald J. Paulik.
In: Systems Analysis for Great Lakes Water Resources, p 11-20, October 1969. 10 p, 7 ref. OWRR Project A-999-OHIO (3).

Descriptors: *Simulation analysis, *Model studies, *Fisheries, *Fish management, Project planning, Great Lakes, Economics, Decision making, Lakes.

A continuing series of simulation models for use as basic planning devices by fisheries management agencies was proposed. The models developed would be open-ended, modular and evolutionary. Although these models would be for managing fisheries, major sectors of the lacustrine ecosystem as well as regional economics would be included as integral parts. First in the discussion was a description of the characteristics of fisheries, especially those of the Great Lakes. Then general characteristics of a simulation model for management agencies, which would provide an easily used accounting system, and experimentation with short-range and long-range effects of management policies, were given. For a model building program, it was suggested that various government agencies involved in fishery resources of the Great Lakes form in conjunction with a group of universities with model building expertise a consortium to construct a series of large-scale simulation models of the Great Lakes fisheries. During the first few years of the model building program, the uses of the models would be: (1) to serve as a data bank and line atlas; (2) to aid decision makers in evaluating tactical alternatives; and (3) to help assign priorities to basic research projects. SOME MICROBIAL-CHEMICAL INTERACTIONS AS SYSTEMS PARAMETERS IN LAKE ERIE,
Ohio State Univ., Columbus. Microbial and Cellular Biology.
P. R. Dugan, J. I. Frea, and R. M. Pfister.
In: Systems Analysis for Great Lakes Water Resources, p 21-28, October 1969. 8 p, 2 fig, 16 ref. OWRR Project A-999-OHIO (3).

Descriptors: *Systems analysis, Data collections, *Algae control, *Lake Erie, Biochemical oxygen demand, Bacteria, Ecology, Water pollution effects, Lakes, *Cyanophyta, *Eutrophication, Water quality.

Some microbial-chemical interactions as systems parameters in Lake Erie were presented. One of the major problems cited was the increased growth rate of blue green algae and other microorganisms in the lake which have led to objections because of decreased recreational value, mortality of fish and domestic animals, clogging of water supply intake filters, and depletion of oxygen in the water. Four general parameters were considered in relationship to accelerated growth of blue green algae: (1) amount of light (energy); (2) nitrogen supply; (3) CO2 or CO3; and (4) minerals. Several observations were made from data collected in the western basin of Lake Erie during the spring and summer of 1969. Using BOD as an example of recycling, role of bacteria in making nutrients available for algae growth was shown significant; and algae, once above a critical concentration significantly enrich their own environments with organics, which in-

dicated a spiraling increase in rate of eutrophication. Suggestions for decreasing algae and bacteria population in the lake were: preventing organic and mineral nutrients from entering the water column and removing sediments of relatively high organic content physically or allowing them to decrease naturally. (See also W71-04756) (Kriss-Cornell)
W71-04758

DEVELOPMENT OF AN OXYGEN-BASED PERFORMANCE MODEL FOR THE WESTERN LAKE ERIE PHYSICO-BIOLOGICAL SYSTEM,
Ohio State Univ., Columbus. Dept. of Microbiology.
C. I. Randles, T. Y. Li, K. S. Shumate, and S. Stollmack.
In: Systems Analysis for Great Lakes Water Resources, p 29-35, October 1969. 7 p, 1 fig. OWRR Project A-999-OHIO (3).

Descriptors: *Systems analysis, *Mathematical models, *Oxygen, Data collections, *Lake Erie, Organic loading, Social aspects, Economics, Lakes, *Input-output analysis, Water quality.

A performance model for the western Lake Erie physico-biological system that will provide a sound base for determining the 'best' uses of the system in a socio-economic sense using a systems analysis approach was proposed. Mathematical modeling of processes in the basis, or submodels of the system, provided the basis for selecting significant parameters, via quantitized analyses, included in the overall system model. Oxygen provided the best combination of characteristics needed for the common measure of performance of the system because of its usability, inclusiveness, and scientific soundness. Major inputs, outputs, processes and influencing factors for measuring the state and changes in state of the physico-biological were illustrated and general comments were made about the system. Two special cases, one where there were no inputs or outputs of either organic materials or oxygen (a closed system), and one where the system is in a steady state (inputs and outputs of oxygen and organic materials were balanced) were mentioned although could not be used for western Lake Erie. Specific data needed for the conceptual model were: organic and oxygen inputs in influent rivers; organic and oxygen outputs to central basin; organic inputs or outputs to sediments, organic outputs in the form of fish, insects, algae, etc., oxygen inputs from or outputs to the atmosphere; and photosynthesis and respiration. (See also W71-04756) (Kriss-Cornell)
W71-04759

PRELIMINARY POLICY MODELS FOR GREAT LAKES REGULATION,
Cornell Univ., Ithaca, N.Y. Dept. of Water Resources Engineering.
Daniel P. Loucks.
In: Systems Analysis for Great Lakes Water Resources, p 37-45, October 1969. 9 p, 1 fig, 6 ref. OWRR Project A-999-OHIO (3).

Descriptors: *Stochastic processes, *Mathematical models, *Optimization, *Great Lakes, *Regulated flow, Short-term planning, Long-term planning, Lakes.
Identifiers: Policy models.

Development of preliminary models to partially regulate lake levels and outflows of the Great Lakes were proposed. First some discussion of the existing regulation policy was useful for understanding potential and limitations of future increased regulation. The general interest groups affected by variations in lake levels and outflows were said to be shore property or riparian interests, navigation interests, and power interests. The first set of policy models examined were for defining alternate short-run policy functions and the second set were for long-run policy models. These stochastic optimization models for defining policies could be jointly used to effectively define and evaluate Great Lakes regulation policies. Short-run policies for the entire lake system would be restricted to indicating how much to release from Lake Superior (most upstream lake) and Lake Ontario (most downstream lake), and how much to divert into and/or from each of the lakes, in order to minimize the expected loss resulting from deviations from the target range of lake levels and outflows. The long-run models would specify not only the preliminary operating policy but also the targets and capacities that together with the policy achieves the objective. W71-04760

AN INTERINDUSTRY FORECASTING MODEL WITH WATER QUANTITY AND QUALITY CONSTRAINTS,
West Virginia Univ., Morgantown. Dept. of Economics.
William Miernyk.
In: Systems Analysis for Great Lakes Water Research, p 49-58, October 1969. 10 p, 1 fig, 7 ref. OWRR Project A-999-OHIO (3).

Descriptors: *Input-output analysis, *Leontief models, Constraints, *Water quality, *Water supply, *Colorado River Basin, *Forecasting, Economics, Industries, Water pollution control.

A method used to make long-range projections of economic activity in the Colorado River Basin with water quantity and quality constraints was described. Six sets of projections were made, one for each sub-basin of the Colorado River Basin, with 1980 and 2010 as the target years. The forecasting model was the conventional open Leontief input-output model with changing input coefficients. Separate transaction tables were constructed for each of the six sub-basins, with 1960 as the base year. Non-agricultural and agricultural data were collected and linked together by balancing import rows and export columns, the result being a 'pure' interregional interindustry model. A flow diagram of the computational procedures, which involved eleven steps for input-output projections, was shown. Two sets of projections were completed, one for water quality only and the other involving both quantity and quality constraints. Three general illustrative cases, for agricultural sectors, commercial and industrial users, and municipal users, were sketched. In order to measure damages due to water quality degradation, total gross output as given by the quantity constrained projections, minus total gross output in the quality-constrained projections was used. SOME DETERMINANTS OF DETROIT'S REGIONAL SHARE OF ECONOMIC ACTIVITY IN SELECTED INDUSTRIES,
Wayne State Univ., Detroit, Mich. Dept. of Economics.
John Mattila.
In: Systems Analysis for Great Lakes Water Resources, p 59-73, October 1969. 15 p, 10 tab, 1 append. OWRR Project A-999-OHIO (3).

Descriptors: *Regional analysis, *Taxes, *Industrial production, Income, Growth rates, Correlation analysis, Regression analysis, Michigan, Costs, Industries.
Identifiers: *Detroit.

The impact of additional taxes in conjunction with wages, interest and capital investment, on changes in income and employment for selected industries in the Detroit metropolitan area, possibly because of the cost of fighting water pollution, was examined. These industries, the major exporters of the area, included: motor vehicle, machinery, fabricated metals and primary metals. The dependent variables in the model were the national growth component, the industry-mix component (difference between industry's national growth rate and overall national growth rate), and the regional-share component (difference between industry's national and local growth rates). These variab were expressed in terms of income or employm gained or lost as a result of differential gro rates. Total state and local taxes and total prope taxes collected annually in Macomb, Oakland a Wayne counties were used as the two alternati tax variables. Simple correlation coefficie between regional share variables devulged so agglometation relationships existing amo Detroit's export industries. From these regress coefficients, first approximations to state and lo tax impact multipliers were computed. This a proach demonstrated considerable year-to-y variation in state and local taxes in Detroit relati to state and local taxes in the rest of the natio (See also W71-04756) (Kriss-Cornell)

REGIONAL TRADE AND STRUCTURE MODI FOR POLLUTION ABATEMENT STUDY,
Ohio State Univ., Columbus. Dept. of Economics
Richard T. Stillson.
In: Systems Analysis for Great Lakes Wat Resources, p 75-89, October 1969. 15 p, 2 fig, append. OWRR Project A-999-OHIO (3).

Descriptors: *Optimization, *Simulation analys *Model studies, Regional analysis, *Pollutio abatement, Economics, Lake Erie, Costs, Co straints, Lakes, Water pollution control, Wat quality.

Outlines of a regional trade model useful in dete mining the likely economic impact of vario proposed pollution abatement programs for th Western Basin of Lake Erie were presented. Th model was designed to analyze the likely econom impact of implementation of 'The Lake Erie R port: A Plan for Water Pollution Control' whic proposed several abatement programs includin construction for sewers, secondary and tertiar treatment facilities of municipal waste and enforc ment of a high standard of industrial treatmen facilities. Interregional activity analysis was broke down for each region into: (1) production of fina products, (2) production of intermediate product and (3) shipment of every commodity from eac region. A sample input-output matrix of such ac tivities was shown. This activity analysis was use to formulate a programming model to allocat given resources among activities. The variabl maximized was the gross return to regiona resources and to shipping. The four constraints o the activity levels were: (1) material balances, (2 final resource constraints, (3) capacity constraints and (4) non-negativity constraints. The model wa used to simulate short run impact of abatemen programs with four major effects on a regiona economy: (1) taxation effect, (2) water input ef fect, (3) industrial control effect, and (4) abate ment as a user of resources. The model was to b simulated for the Detroit-Toledo area using input output coefficients for 1963. (See also W71 04756) (Kriss-Cornell)

TRADE STUDY RELEVANT TO POLLUTION ABATEMENT IN THE WESTERN BASIN OF LAKE ERIE,
Ohio State Univ., Columbus. Dept. of Economics.
Thomas C. Webster.
In: Systems Analysis for Great Lakes Water Resources, p 91-110, October 1969. 10 p, 7 tab OWRR Project A-999-OHIO (3).

Descriptors: *Regional analysis, *Pollution abatement, *Lake Erie, Industrial production, Data collections, Statistics, Lakes, Water pollution control, Costs, Water quality.
Identifiers: *Trade study.

Data, which will provide a description of those industries important to the economy of the Western Basin and engaged in regional trade for use in the Regional Trade Study of the Western Basin of Lake Erie, was given. The geographic area constituting the industrial sector of the Western Basin was

fined as the metropolitan areas of Detroit and ledo. Industries included in the model were as- ned to have similar technologies and therefore affected by pollution abatement programs in ilar ways. In Table 1, these industries were clas- ed according to the Standard Industrial Classifi- ion (SIC) system and a description of each pro- ed a breakdown of the various products they duce. Table 2 listed data for the adjusted value led by manufacturing for each selected or major ustry group in the Detroit-Toledo SMSA and percentage of the total value added by manu- turing for each selected industry. The distance ch the commodities produced by the various in- tries are transported, as given by the '1962 Cen- of Transportation' was given in Table 3. Table 4 wed the degree of concentration of the various stries within the fifteen largest producing re- s for each industry. Aggregates that will be in the regional trade model were shown in le 5. Adjusted values added by each industry percentage of the total value added to each in- ry aggregation were given in Tables 6 and 7 ectively. (See also W71-04756) (Kriss-Cor- -04764

al approaches used to synthesize some major es of the fields of sanitary engineering, lim- y, hydrodynamics, ecology, and operations ch into a unified methodology of water quali- nagement were discussed. The basic objec- of the analytical framework were to: (1) nine underlying casual relations between discharges and water quality; (2) develop ds of forecasting water quality on long-term hort-term basis; (3) analyze interactions en water quality and water use; and (4) p methods and guidelines for optimal ement. Equations were developed which ex- d the cause and effect relationships between such as waste discharge, and output, such as ed oxygen. A systems approach was applied er quality problems of the Delaware Estuary area from Trenton, New Jersey to Liston Delaware. The survival of anadromous fish, the American shad, was cited as an example effect of discharge of municipal and industri- es resulting in poor water quality. A non- state mathematical model was developed ssolved oxygen as the indicator variable. A Kutta approximation was used to numeri- tegrate sets of equations. Using a survival n and arrival times of fish, an average per- rvival of the total population was estimated. entation of this program to the Delaware was described. (See also W71-04756) Cornell)

MS ANALYSIS, WATER QUALITY AND RNMENT DECISION MAKING,
ork State Dept. of Health, Albany. Environ- Health Services.
letling, and Dwight Metzler.
tems Analysis for Great Lakes Water es, p 129-135, October 1969. 7 p, 1 fig, 9 RR Project A-999-OHIO (3).

Descriptors: *Systems analysis, Water quality, *Decision making, *Governments, Management, Economics, Technology, Surveys, Water pollution control.
Identifiers: Potomac River Basin.

Inter-actions between systems analysis, water quality and government decision making were considered not quantitatively, but based on a subjective interpretation. The method utilized was to examine the relationships implied via a case study of a presently pertinent water quality problem watershed--'The Potomac River Basin'. The proposal model was arbitrary, subjective and non-quantitative. Government was divided into four distinct sectors of activities--Management, Technical Analysis (socio-economic-engineering), Surveillance and Implementation. Actual water quality situations of the Potomac were fitted into the four sectors of the proposed structure. From the case study it appeared that: (1) systems analysis was more predominant in technical studies and surveillance than in governmental activities; (2) little use of these methods have been made by management and in implementation; (3) no attempt was made to utilize the method for the entire system; and (4) detailed technical studies are not utilized in decision making. APPLICABILITY OF SHORT-MEMORY MODES TO ENGLISH RIVER-FLOW DATA,
Birmingham Univ. (England).
N. T. Kottegoda.
Institution of Water Resources Engineers Journal, Vol 24, No 8, p 481-489, November 1970. 9 p, 8 fig, 7 ref.

Descriptors: *Mathematical models, *Time series analysis, *River flow, Statistics, Annual, Monthly.
Identifiers: *Hurst phenomenon.

A mathematical model for time-series of river flows was undertaken in order to predict the characteristics of future water supplies as a pre-requisite to the planning of water resource projects. In this first stage several statistical tools, such as the range covariance, and special analysis, were used to examine the structure of river-flow records. Three separate estimates of an exponent H (the Hurst phenomenon), which is expected to lie in the range 0.5 to 1.0 and is a measure of the steadiness of the river flows, were made for these five rivers: Elan Valley, River Severn at Bewdley, the Alwen, the Brenig, and the River Derwent at Yorkshire Bridge. Initially, annual values used for the analysis and results in respect to two of the catchments were shown (Elan Valley and River Severn at Bewdley). A biassed value of H seemed to be propagated by annual values and therefore a rescaled range of monthly flows was made and range diagrams were provided. The effects of cycles and the slopes of spectral diagrams gave the other estimates of H. H provided a critical factor in determining the best type of model with predictability of river flows decreasing as H increased. (Kriss-Cornell)

Identifiers: *Socio-economic problems, *Grand Traverse Bay.

The University of Michigan's Sea Grant Institutional Support Program, a multidisciplinary program begun in July 1969, was described as an experiment in the mobilization of resources of an educational institution to deal more effectively with current societal-environmental problems. Using a systems approach, the exploration of resource development alternatives was carried out through manipulation of predictive models of the marine resource system and the directly interlocking portion of the socio-economic system. Eight integrative functions were used to deal comprehensively with the problems and opportunities arising from the six major resource attributes of the Great Lakes: lake levels; water quality and circulation; plants and animals produced; size, depth and minerals of basin; unique character and configuration of shoreline; and regional, climate. In order to approach this long-term resource-planning objective, the Grand Traverse Bay was selected as the focus of pilot efforts to develop a complete model of a small part of the Great Lakes ecosystem. The predictive model was developed through a set of 'specific process sub-models' which generated the interactions or transfer process among the components of the system and interfaced with one another in a complex pattern. To provide data needed to develop these models, twelve field research projects were initiated. (Kriss-Cornell)

6B. Evaluation Process

A WILD AND SCENIC RIVERS SYMPOSIUM.
Idaho Univ., Moscow. Water Resources Research Inst.

Available from NTIS as PB-197 527, $3.00 in paper copy, $0.95 in microfiche. Herbst, John R. and Michalson, Edgar L., editor. Idaho University Water Resources Research Institute Information Bulletin No 6, August 1970. 41 p, append. OWRR Project No B-014-IDA (1).

Descriptors: *Wild rivers, *Natural streams, *Natural resources, *Water resources, *Idaho, Aesthetics, Scenery, Preservation, Wild River Act, Water policy, Surface waters, Planning, Water utilization, Wildlife conservation, Fish conservation, Water control, Conferences.
Identifiers: *Wild and scenic Rivers symposium (Idaho).

This paper discusses the viewpoints of people of varied backgrounds and interests on the subject of wild and scenic rivers as expressed at the Wild and Scenic Rivers Symposium held at Salmon River Lodge, Idaho, July 25-27, 1969. The discussion covers most of the main points of wild rivers, from the plea to save some rivers for posterity to the developmental opportunities that rivers afford. Several conclusions were drawn from the Symposium. First, the 'Wild and Scenic Rivers Act' enacted by Congress is not a water project development act, but because there is some question as to development opportunities it was suggested that benefits foregone should be measured. A method to indicate the importance of aesthetic values should be developed, and the problem of identifying aesthetics needs resolved. Emphasis should be placed on alternative methods of wild and scenic river evaluation. This is a broader problem than just economics or engineering. Education of the public in terms of wild and scenic rivers is needed, as well as providing means for the public to express their preferences. (See also W71-04420) (Woodard-USGS)

A METHODOLOGY STUDY TO DEVELOP EVALUATION CRITERIA FOR WILD AND SCENIC RIVERS,
Idaho Univ., Moscow. Water Resources Research Inst.
Fred J. Watts.
Water for Municipal and Industrial Use Subproject, Report, Water Resources Research Institute, Aug, 1970. 39 p, 19 tab, 4 ref, 1 fig. OWRR Project B-014-IDA (2).

Descriptors: *Wild rivers, Municipal water, Industrial water, Economic prediction, Idaho.
Identifiers: Public Law 90-542, Salmon River, Idaho Economic Base Study for Water Requirements, National Wild and Scenic Rivers System.

The Scenic Rivers Study Unit of the Water Resources Research Institute at the University of Idaho is attempting to identify valid criteria for evaluating rivers for wild or scenic classification. By studying the economic, aesthetic, scenic and other values of the Salmon River in Idaho, the study unit hopes to establish a methodology for planning the selection, use and management of wild and scenic river systems. The study of the Salmon River has been divided into eleven subprojects, each related to one of the resource or service functions of the river. This subproject on the municipal and industrial uses of the Salmon River attempted to catalogue this information for the present as well as future employment and population conditions up until the year 2020. THE SUSQUEHANNA COMMUNICATION-PARTICIPATION STUDY: SELECTED APPROACHES TO PUBLIC INVOLVEMENT IN WATER RESOURCES PLANNING,
Institute for Water Resources (Army), Alexandria, Va.; and Michigan Univ., Ann Arbor.
Thomas E. Borton, Katharine P. Warner, and J. William Wenrich.
IWR Report 70-6, Dec 1970. 128 p, 44 ref.

Descriptors: *Planning, *Community development, *Urbanization, *Institutions, Social aspects, Social values.
Identifiers: *Public participation, Citizen involvement in planning, Survey questionnaires, Community planning.

This research was conducted by the Environmental Simulation Laboratory and the Institute for Social Research of the University of Michigan. The study represents an effort to introduce and evaluate selected approaches to public involvement in the Susquehanna River Basin Study. The public involvement activities centered upon establishing a program of lined contacts between agency planners and local residents. Some of the important activities were identification and interviews with local opinion leaders, mailing of brochures, newsletters, and surveys, and workshops and forum meetings. Questionnaires were used throughout the study to evaluate changes in attitudes and the effectiveness of the techniques used. The findings indicate that the workshops were particularly successful in improving the understanding of attitudes and objectives between the agency planners and local representatives. The research evolved a public participation process model indicating the relation of public involvement to the phases of planning. (See also W71-04424)

PUBLIC PARTICIPATION IN WATER RESOURCES PLANNING,
Institute for Water Resources (Army), Alexandria, Va.
A. Bruce Bishop.
IWR Report 70-7, Dec 1970. 109 p, 27 ref.

Descriptors: *Planning, *Community development, *Urbanization, *Institutions, Social aspects, Social values, Social change.
Identifiers: Public participation, Planning methodology, Community planning, Decision-making.

Public concern over the use of the nation's natural resources has led to increased citizen participation in the public works planning process. This report focuses on the development of water resources in relation to the role of the planner in communicating and interacting with the publics in planning. It describes the institutional and behavioral aspects of planning as a process of social change, offers a descriptive model of the planning process, and with this as a framework discusses methods and approaches for developing public participation in planning studies. Six public participation program objectives are set forth to guide the organization of citizen involvement in planning studies. Initially, the planners should identify concerned local interests and establish working relationships with them in order to legitimize the study. A number of methods for working with the public are descrit including information campaigns, sample surv group advocacy, informal contact with local terests, community workshops, citizens' com tees, special task forces, public inquiries, public hearings. The use of a factor profile discussed as a method for presenting, discus and evaluating the social, environmental and c munity effects, together with the economic eff of alternative planning proposals. REGIONALIZATION IN THE CONTEXT MULTIOBJECTIVE PLANNING AND EVALU TION,
Institute for Water Resources (Army), Alexand Va.
L. G. Antle, and R. J. Struyk.
Center for Economic Studies, Paper 70-2, Octo 1970. 17 p.

Descriptors: *Regional analysis, *Cost-ben analysis, *Decision making, *Economic justif tion, Feasibility, Social aspects.

This paper comments on the July 1970 draf 'Procedures for Evaluation of Water and Rela Land Resources Projects', the new multiple-ob tive planning process which is under considera by the Water Resources Council. The paper cepts the basic philosophy of the new procedu but points up certain problems especially conce ing the choice of regions to display informat required under the new procedures. In particula is necessary that off setting impacts not be c cealed, so that area affected differently should be consolidated into one region. This is import for secondary as well as primary benefits. T authors comment upon action of the office of B ness Economics, Department of Commerce (OB which is preparing estimates of economic impa by region for this and other purposes. Differen in defining planning regions for natural resou programs and for urban-oriented programs is p ticularly important. The OBE regions will be ba upon city regions each with its hinterland. As fa possible Standard Metropolitan Statistical ar (SMSA) are to be used. The authors point out t the analytical purposes of the OBE regions often not correspond to the 'project regions' o the 'displacement regions' within which influen such as project employment and project visitat are important. Formal defining of displacement gions is an important step, which however is not far required under the proposed new procedu (Whipple-Rutgers)

DISCUSSION OF DRAFT REPO PROCEDURES FOR EVALUATION OF WAT AND RELATED LAND RESOURCES PR JECTS,
New York State Dept. of Conservation, Alba Div. of Water Resources.
Nicholas L. Barbarossa.
Presented at third Annual Conference of Fede and State Officials, Salt Lake City, June 24, 19 11 p.

Descriptors: *Cost-benefit analysis, *Decisi making, *Social aspects, *Environment, Benef Direct benefits, Economic efficiency, Econon justification, Feasibility, Natural resources, Val National income, Regional analysis.

This is a critique of a 1969 draft of the new Wa Resources Councils proposals for multiple obj tive planning. The new principles propose that tional income, instead of being the prime objecti as previously, shall be only one of four objectives which three deal with social, environmental and gional objectives. The author objects strongly these proposed new principles because in his vi the change is still insufficient. He would burn t bridge to the past and abandon the benefit cost a proach altogether. He considers that national

e should not be a stated objective, and should eplaced by a general objective 'to develop the promising water resources projects at least o serve the many needs of the people.' Among views of the author, he opposes the opportu- cost approach to government discount rate culous'), and the view that secondary benefits d be ignored because they will generally can- it ('academic hash'). He considers that secon- benefits would be very much greater in the eastern United States than in other regions. pple-Rutgers)

ECONOMIC GROWTH AND ENVIRONMENTAL COSTS,
Coe Coll., Cedar Rapids, Iowa.
John K. Chapman.
In: Man and the Quality of His Environment, Boulder, University of Colorado Press, 1968, p 231-239.

Descriptors: *Economics, *Environmental quality, *Water pollution, *Air pollution, Prices, Costs, Planning, Diseconomics of scale, Income, Population, Sewerage, Input-output, Regional analysis.
Identifiers: *Economic growth, *Boulder Colorado, Externalities, Multiplier effect.

This paper presents a study of the Boulder, Colorado economy in order to point out how economic growth can create environmental problems. The major purpose of this study was to utilize input-output analysis to trace the total income and employment effects of federally funded space research and production spending by several local establishments. However, the author uses this study to analyze the problem of the external diseconomics of scale which accrue to agglomerates of people with particular attention paid to the problems of air and water pollution. The difficulties arise because both the direct and indirect effects of pollution occur outside the market system. The author separates the costs into accommodation costs which arise out of the need to accommodate more people with higher incomes and removal costs which are costs arising out of air and water pollution. In conclusion, the author sees the need for a much larger effort in this type of analysis than is presently being made. (Murphy-Rutgers)
W71-04451

THE EXPOST EVALUATION OF FEDERAL WATER RESOURCE PROJECTS IN THE UNITED STATES,
Department of the Army, Washington, D.C.
Jim J. Tozzi.
Organization for Economic Cooperation and Development Seminar on Expost Evaluation, the Hague, Netherlands, October, 1970. 18 p.

Descriptors: *Economic evaluation, *Cost-benefit analysis, Flood control, Income, Taxes, Government, Multi-purpose projects, Recreation, Social aspects, Navigation, Costs, Transportation, Planning.
Identifiers: *Expost evaluation, *Corps of Engineers, Income redistribution, Dewey Reservoir, Arkansas River.

Expost evaluation of water resource projects refers to the assessment of their observed effects on the natural, economic and social environment. Relying upon the experience of the United States Army Corps of Engineers the author attempts to present the technique of expost evaluations and discusses the merits of this approach. The paper also identifies and explains some of the basic analytical principles involved in expost evaluation and gives specific examples of their application in water resource projects. The discussion includes the national income and income redistribution effects of water investments. The author concludes that post-construction evaluations are no less feasible than the usual pre-construction evaluations. (Murphy-Rutgers)

EVALUATION METHODOLOGY OF URBAN AND REGIONAL PLANS: A REVIEW,
London Univ. (England). School of Environmental Studies.
Nathaniel Lichfield.
Regional Studies, Vol 4, No 2, p 151-165, August 1970.

Descriptors: *Cost-benefit analysis, *Economic evaluation, Decision making, Linear programming, Feasibility, Systems analysis.
Identifiers: *Planning Balance Sheet, *Project appraisal, Cost effectiveness, Externalities, Public sector investment, Objective function, Net benefit.

The article makes a review of methods currently used or proposed for evaluation of prospective projects. The author feels evaluation methodology should satisfy certain criteria, such as complying with stated objectives, considering all costs including externalities and all benefits in money terms and finally indicating the incidence of costs and benefits on all parts of the community. The main methodologies studied are the Planning Balance Sheet, investment appraisal, cost minimization, cost effectiveness, and cost-benefit analysis. In cost minimization, the end product is assumed constant while in cost effectiveness, the end product is variable. Linear programming is considered under cost benefit techniques. The author finds that where a cost-benefit analysis is carried out in a comprehensive manner in relation to the systems and sectors of interest, this analysis becomes a Planning Balance Sheet. Of the methods considered, only cost benefit analysis fulfils the outlined criteria and is sufficiently comprehensive. This article is relevant for water research efforts interested in comparing alternative project evaluation techniques. (Siegenthaler-Rutgers)

POLICY MATTERS IN INVESTMENT DECISION-MAKING,
International Bank for Reconstruction and Development, Washington, D.C.
S. A. McBride.
Regional Studies, Vol 4, No 4, p 241-253, August 1970.

Descriptors: *Cost-benefit analysis, Decision-making, Economic evaluation, Interest rate, Economic efficiency, Systems analysis, Welfare economics, Budget constraint.
Identifiers: *Multiple objective function, Net benefit, Income redistribution, Opportunity cost, Externalities.

This paper proposes a benefit-cost framework that simultaneously treats multiple objectives, as well as other matters of policy. The author attempts to illustrate the importance of policy determination in investment decision-making. The framework provides an estimate of the first round net benefits generated by the investment for multiple objectives. To simultaneously treat the objectives of economic efficiency and income redistribution, the objective function is formulated by weighting the net contribution that projects make to each objective subject to constraints. It is shown that the outcome depends largely on the policy-makers statement of objectives, the relative values assigned to the contributions to these objectives generated by the investment and the selection of an interest rate and economic life of the project. The model does not consider the multiplier incomes generated from increased spreading by beneficiaries of the project. This article is relevant for possible application to multipurpose project evaluation. (Siegenthaler-Rutgers)
W71-04454

TECHNIQUES FOR PROJECT APPRAISAL UNDER UNCERTAINTY,
International Bank for Reconstruction and Development, Washington, D.C.
Shlomo Reutlinger.
World Bank Staff Occasional Papers, Number 10, 1970. 95 p.

Descriptors: *Cost-benefit analysis, *Uncertainty, Probability, Correlation analysis, Decision making, Risk, Feasibility, Economic evaluation.
Identifiers: *Project appraisal, *Aggregation problem, Bias, Standard deviation, Public investment, Sensitivity analysis, Rate of return, Present value, Maximum likelihood.

The primary purpose of this study is to present a feasible method for evaluating the riskiness of investment projects. A second objective is to show how quantitative evaluations of the riskiness of projects might be used in various decision problems. The emphasis is on methodology and problems of measurement. The paper recommends that the best available judgments about the factors affecting cost and benefit estimates of a project can be estimated via probability distributions. These distributions can be aggregated mathematically to yield a probability distribution of the rate of return, or net present worth of the project. The author discusses the nature of uncertainty and the kind of judgments that are basic ingredients for decision-making. He singles out the probabilistic approach as most suitable for project appraisal. The paper considers the aggregation of probability distributions of relevant factors and parameters into a probability distributions of the economic returns of a project. Case studies are used to illustrate the application of the method. This paper is relevant for the evaluation of water resource projects which have identifiable risks associated with either cost and/or benefit projections. (Siegenthaler-Rutgers)

COST-BENEFIT ANALYSIS AND THE THEORY OF PUBLIC FINANCE,
Harvard Univ., Cambridge, Mass.
Richard A. Musgrave.
Journal of Economic Literature, Vol VII, No 3, p 797-806, September 1969.

Descriptors: *Cost-benefit analysis, *Economic evaluation, *Welfare economics, Financing, Investment, Decision-making, Planning, Management, Economic efficiency, Optimization, Government, Income, Rate of discount, Taxes.
Identifiers: *Public finance, *Social goods, *Opportunity cost, Distributional objectives.

This paper is concerned with the application of cost-benefit analysis to the determination of public expenditure policy and its relation to the central economic theory of social goods. It is argued that cost-benefit analysis can perform most effectively in the case of an intermediate social good. The author examines the relation between investment mix and total investment and the way in which the means of finance enter the profitability calculation. On the problem of distributional objectives, the author argues against the inclusion of value weights into the objective function for the particular investment and instead favors a policy which combines various instruments to secure various targets. The author concludes that cost-benefit analysis, even if combined with traditional tax analysis does not provide a substitute theory of public finance. Because of the clarification of the principles behind cost-benefit analysis and the public good aspects of water resources, this article is relevant to the water researcher. (Murphy-Rutgers)

WATER POLLUTION,
Mersey and Weaver River Authority (England).
C. Lumb.
In: Technological Injury, New York, Gordon and Breach, 1969, p 29-51.

Descriptors: *Pollution, *Water resources, *Technology, Water supply, Water quality, Water demand, Rivers, Effluents, Sewage, Waste water, Pesticides, Water law, Oxygen.
Identifiers: *Oil contamination, Synthetic detergents.

This paper reviews the adverse effects which technological developments have had on the pollution of water and water supplies. The principle uses made of water resources are of two types: (1) abstractions from sources of supply for domestic, manufacturing, cooling and irrigation purposes; and (2) uses in site for fisheries, navigation, and recreation purposes and for the conveyance of waste effluents. After summarizing these uses the author examines some of the ways in which these may be threatened by technological developments. There is a discussion of pollution by sewage effluents, by the chemical industries, by oil refining, by metal finishing industries, by agriculture, by pesticides, and by radioactivity. For each type of pollution, the economic, social, and technological magnitude of the problem is outlined. The need for controlling pollution is discussed and the legal position of pollution control in Great Britain summarized. This article has relevant extensions to pollution problems in the United States. (See also W71-04465) (Murphy-Rutgers)
W71-04466

PROBLEMS IN IMPLEMENTING PROGRAM BUDGETING,
California Univ., Los Angeles.
George A. Steiner.
In: Program Budgeting, edited by Novick, David, Cambridge, Harvard University Press, 1967, p 308-352.

Descriptors: *Budgets, *Management, *Decision-making, *Government, Cost-benefit analysis, Social aspects, Planning, Political aspects, Pollution, Resource allocation, Time.
Identifiers: *Program budgeting, *Relevant alternatives, National Environmental Health Center, Magerial discretion.

This study examines the many impediments to the rapid expansion of program budgeting and long-range planning in the analysis of government projects. Program budgeting is a useful tool in water resource projects and the author's treatment of these problems should be of interest to the water researcher. The program budgeting concept is outlined and a brief history of its use is presented. Of particular interest to the water researcher is the case study of the National Environmental Health Center which was designed to study air, water and land pollution. The growing recognition of the benefits of the program-budgeting system has resulted in its adaptation in many government agencies. The system permits more rational decisions and better management by fostering a more complete analysis of alternative investment proposals. (Murphy-Rutgers)

PROGRAM BUDGETING--APPLYING ECONOMIC ANALYSIS TO GOVERNMENT EXPENDITURE DECISIONS,
Washington Univ., St. Louis, Mo.
Murray L. Weidenbaum.
In: Planning-Programming-Budgeting--A Systems Approach to Management, Chicago, Markham Publishing, p 165-180, 1967.

Descriptors: *Program budgeting, Decision-making, Cost-benefit analysis, Economic evaluation, Resource allocation, Discount rate, Economic efficiency, Systems analysis.
Identifiers: *Planning-Programming-Budgeting, Government expenditures, Cost effectiveness analysis, Externalities.

This paper evaluates the trend toward the application of economic analysis to public sector decision-making. Antecedents of Planning-Programming-Budgeting (PPB) are discussed to provide the groundwork for an evaluation. The use of cost-benefit analysis by Federal agencies to rank a compare prospective projects demonstrates the of objective economic analysis to narrow the ar in which political forces may operate. T Planning-Programming-Budgeting-System (PP is a combined planning and budgeting proc where national goals are reduced to specific gram operations and the most economical meth of executing these objectives is identified. Th steps are required in the PPB system; namely, identification of national goals, the relation broad goals to specific alternative programs the translation of the resource inputs into bud dollars. The author finds the long term impact PPB to be beneficial as there is less reliance on s jective judgment with information on the econo returns of the respective programs. This articl relevant for water administrators concerned w the application of PPB to water resource progra (Siegenthaler-Rutgers)

SYSTEMS ANALYSIS TECHNIQUES F PLANNING-PROGRAMMING-BUDGETING,
Rand Corp., Santa Monica, Calif.
E. S. Quade.
In: Planning-Programming-Budgeting: A Syste Approach to Management, Chicago, Markh Publishing, 1967, p 292-312.

Descriptors: *Systems analysis, Decision-maki Linear programming, Operation research, Unc tainty, Economic efficiency, Queueing theory.
Identifiers: *Planning-Programming-Budgeti Objective function, Cost-effectiveness analysis.

Systems analysis is an analytic study designed help a decision-maker identify a preferred cho among possible alternatives. The possible appli tion of the systems analysis to Planning-P gramming-Budgeting (PPB) is considered. T systems analysis method constructs and opera within an abstraction of the actual problem. T analysis process first considers the decision-mak objectives, then alternative strategies, and th respective costs. The model estimates for each ternative the costs that would be incurred and extent to which the objectives would be attained criteria weighs costs against performance and ranges the alternatives in order of preference. T uniqueness of the method is the emphasis on whole problem, the use of uncertainty and quant cation using mathematical models all based scientific methods. The article is relevant for wa administratorsconcerned with decision-maki models to apply to project evaluati (Siegenthaler-Rutgers)

PUBLIC EXPENDITURE BUDGETING,
Michigan Univ., Ann Arbor.
Peter O. Steiner.
Washington, The Brookings Institution, 1969. 1 p.

Descriptors: *Budgeting, *Decision-making, Co benefit analysis, Resource allocation, Welfa economics, Discount rate, Economic efficien Constraint.
Identifiers: *Public expenditure, *Public intere Externalities, Transaction costs, Public good, O jective function, Opportunity cost.

The author considers the political-econom process of reaching and implementing public e penditure decisions. The theory of public expen ture is considered as two different proposition namely, the theory of marginal public expenditu and the theory of the public interest. The public terest discussion is concerned with the manner which demands for public activity are articulat and legitimized. Although alternative views on t nature of the public interest reveal no consensu the author stresses that collective social priorit can be inferred from past social actions and c serve as a guide to public decision-making. To a ticulate the public interest, a multi-dimensional o

e function is preferable to a single dimen-
one stressing efficiency in order to avoid bias
valuation of intangibles. Marginal public ex-
ture theory is concerned with how the deci-
naker chooses among competing demands
constraints. Cost-benefit analysis is relevant
or project selection and public decision-mak-
ut the author advocates better measurements
efits and costs rather than conceptualization.

MULTIPURPOSE BUDGET SYSTEMS,
Brookings Institution, Washington, D.C.
Allen Schick.
In: Program Budgeting and Benefit-Cost Analysis, p 358-372, 1969.

Descriptors: *Multi-purpose budgeting, *Resource allocation, Economic evaluation, Decision-making.
Identifiers: *Planning-Programming-Budgeting, Crosswalking imperfect integration.

Planning-Programming-Budgeting (PPB) integrates the three core functions of budgeting, control, management, and planning into the budget process. Under PPB, government agencies have to reconcile program accounts with the existing appropriations structure resulting in a 'crosswalk problem'. The Crosswalk problems occur because of the disparity between the classification in the program structure and appropriations and is one aspect of the broader problem of a multipurpose budget system. The success of PPB is contingent on the development of a system that transfers control and management to lower levels and elevates planning. The author suggests that although incompatibilities do exist in a multi-purpose budget strategy, it is possible to integrate the functions through changes in the definitions of roles, improved allocation of budgetary functions and better data utilization. Although integration is cited as a solution, it must be imperfect and gradual in order to develop the optimum level with experimentation and practice. This article is relevant for water administrators concerned with budgetary decision processes. (See also W71-04471) (Siegenthaler-Rutgers)
W71-04473

SURVEY OF USE BY FEDERAL AGENCIES OF THE DISCOUNTING TECHNIQUE IN EVALUATING FUTURE PROGRAMS,
Comptroller General of the United States, Washington, D.C.
Elmer Staats.
In: Program Budgeting and Benefit-Cost Analysis, p 212-228, 1969.

Descriptors: *Economic evaluation, *Cost-benefit analysis, Discounting, Present value, Cost, Water resource development, Resource allocation, Interest rate.
Identifiers: *Implicit discount rate, Explicit discount rate, Opportunity cost, Rate of return.

This article discusses a survey made by the General Accounting office concerning the use of discounting by federal agencies in evaluating future programs. The theory underlying the discounting technique is that calculation of the present values through discounting makes possible a comparison of costs and benefits. These comparisons aid in program evaluation and in the choice between alternative programs. The distinction between implicit and explicit discount rates is cited. The results of the survey indicate a majority of the agencies in the study are planning to use discounting in decision-making. A divergence of opinion on discounting is reflected in agency practices. Differences to exist in that some agencies do not use discounting with the result that decision-making may result in resource misallocation. In conclusion, the author stresses the need for greater standardization in discounting techniques to enhance the quality of decision-making. This article provides a useful background of current Federal discounting policies and should be of general interest for the evaluation of public water investment projects. THE SYSTEMS ANALYSIS APPROACH,
Department of Defense, Washington, D.C.
Alain C. Enthoven.
In: Program Budgeting and Benefit-Cost Analysis, p 159-168, 1969.

Descriptors: *Systems analysis, Decision-making, Risk, Cost-benefit analysis, Resource allocation, Budgeting, Social welfare, Simulation, Feasibility.
Identifiers: *Planning-Programming-Budgeting, Cost-effectiveness, Bias.

The systems analysis approach to problems is to examine an objective in its broadest aspects and develop for the decision-maker information that will aid him to select the efficient method. The selection process requires the identification of alternative ways of achieving the objective and then the estimation of the benefits and the costs of each alternative. The author states the method tries to identify the alternative that yields the greatest effectiveness at the least cost. Limitations of systems analysis include overemphasis on quanitative analysis, a confusion of performance with effectiveness, and a bias toward new approaches in favor of old ones. A discussion of the application of systems analysis to the Defense Department is given with the contribution of the method to the decision-making process stressed. The author stresses that the method can be applied to social problems as well and is important in the design and development of alternative approaches of program development. This article is relevant for water studies concerned with the application of budgeting methods to water resource planning. (See also W71-04471) (Siegenthaler-Rutgers)

PUBLIC EXPENDITURES AND POLICY ANALYSIS.
Grinnell Coll., Iowa; and Pennsylvania Univ., Philadelphia.

Robert H. Haveman, and Julius Margolis (editors). Chicago, Markham Publishing Co., 1970. 596 p.

Descriptors: *Economic evaluation, *Government, *Budgets, *Planning, Risk, Spillover, Income, Cost-benefit analysis, Water pollution, Rate of discount, Prices, Natural resource development, Project planning, Social aspects, Water law.
Identifiers: *Public expenditure analysis, *Institutions, Programming, Externalities, Income distribution, Unemployment, Shadow prices, Collective action.

The papers presented in this volume are intended to survey the theory of public expenditure analysis and evaluate federal government practices in choosing among investment alternatives. This volume should be of particular interest to the economist concerned with improving the efficiency of government decision making in the area of water resource development. In the first section of the book the papers are devoted to exploring the economic basis for public expenditures and other governmental action. Particular attention is paid to the problems of market failure, income distribution and the appropriate economic functions of government. The second section deals with the institutional arrangements which affect the ability of the federal government to implement efficient public expenditure policy. The following section analyzes some of the empirical problems encountered in estimating the benefits and costs of public expenditure alternatives. These include the rate of discount, the treatment of risk and uncertainty, and the effect of unemployed resources. The fourth section contains an evaluation of the Planning-Programming-Budgeting System and its component parts. The concluding section deals with unresolved issues and the next steps for policy analysis and program evaluation in selected functional

areas of the federal budget. (See also W71-04478 thr W71e04482) (Murphy-Rutgers)

THE PUBLIC SECTOR AND THE PUBLIC INTEREST,
Michigan Univ., Ann Arbor.
Peter O. Steiner.
In: Public Expenditures and Policy Analysis, 1970, p 21-58.

Descriptors: *Government, *Economic evaluation, Economic efficiency, Spillover, Decision-making, Discount rate, Costs, Environmental quality, Social aspects, Demand, Welfare economics.
Identifiers: *Public goods, *Market failure, Collective action, *Externalities, Multi-dimensional objective function, Utility, Social welfare, Willingness to pay.

The author attempts to establish a basis of collective concern and for the provision of public goods. This paper provedes and discusses the nature of a public good throug a number of examples. Of particular interest to the water researcher is the dicussion given to those public goods concerned with the quality of the environment. The theories of individual utility, willingness to pay, and aggregate social welfare are presented, along with their economic implications and their role as extramarket forces in the economy. Because noncomparability is a feature of many public choice problems the author stresses a multi-dimensional objective function, which explicitly considers conflicts among objectives, rather than one involving only economic efficiency. The concluding section cosiders how the political structure articulates social priorities and the extent to which the process itself determines the outcome. This paper is relevant to the water researcher interested in defining the proper role of government in water resources development. (See also W71-04477) (Murphy-Rutgers)
W71-04479

EVALUATING PUBLIC EXPENDITURES UNDER CONDITIONS OF UNEMPLOYMENT,
Grinnell Coll., Iowa.
Robert H. Haveman.
In: Public Expenditures and Policy Aanalysis, 1970, p 330-345.

Descriptors: *Income, *Costs, *Economic evaluation, Social aspects, Government, Resource allocation, Demand, Regional analysis, Cost-benefit analysis, Dams, Capital, Investment.
Identifiers: *Unemployment, *Monetary costs, *Real costs, Social costs, Social labor costs.

This paper attempts to improve the methods for evaluating the economic gains and the costs of alternative expenditure projects. It discusses the reasons why monetary costs fail to reflect real social costs when the economy is experiencing unemployment and excess capacity, and presents a method for adjusting monetary costs when such conditions prevail. The implementation of this method eliminates the overstatement of real costs by monetary costs when some of the resources drawn into use by a public expenditure have idleness as their alternative. This paper is of significance to cost-benefit analyses of water resource investments. (See also W71-04477) (Murphy-Rutgers)

SOCIAL RETURNS FROM PUBLIC TRANSPORT INVESTMENT: A CASE STUDY OF THE OHIO CANAL,
California Univ., Riverside.
Roger L. Ransom.
Journal of Political Economy, Vol 78, No 5, p 1041-1060, September-October 1970.

Descriptors: *Economic evaluation, Decision-making, Economic rent, Average cost, Linear programming, Economic efficiency.
Identifiers: *Transportation costs, *External benefits, Bias, Parameter, Constant costs.

Traditionally, the historical approach to canal development has been the study of the decision-making process which led states to undertake a canal project. This paper focuses on the Ohio Canal and estimates the external benefits accruing to the Ohio region as a measure of the contribution of the canal to Ohio's development. To indicate the external returns to the canal, the theory of economic rent is used. The author estimates the return from the Ohio Canal for six three year periods using as data the traffic in exports and imports to the region. The shipment data were adjusted so the pattern of least-cost shipments could be determined by linear programming. The estimates of return were based on current charges by commodity class. The results indicate from 1837-1850, returns from the canal were profitable; however, after 1850 with railroad competition, profits declined. The profitable returns demonstrate the impact of the canal on the development of the market in this region a factor which the railroads utilized. In conclusion the capital investment in the canal was repaid and for that period, the investment was efficient. This article offers a possible methodology to evaluate the impact of a water project on economic growth and development. (Siegenthaler-Rutgers)

WATER RESOURCES DEVELOPMENT NEEDS IN THE SOUTHERN WATER RESOURCES CONFERENCE REGION,
Reuben J. Johnson.
Southern Water Resources Conference, 15th Meeting, Tulsa, July 16-18, 1969. Council of State Governments, Southern Office, Atlanta, nd p 39-44.

Descriptors: *Water resources development, *Water policy, *Water management (Applied), *Southeast U.S., Project purposes, Water utilization, Conservation, Water conservation, Recreation facilities, Interstate commissions, State governments, Local governments, Non-structural alternatives, Water supply, Water pollution control, Public utilities, Planning, Reservoirs, Government finance, Water allocation (Policy), Environment, Aesthetics, Sewage treatment, Personnel, Legislation.

Presented at the fifteenth meeting of the Southern Water Resources Conference, this speech presents an analysis of the sixteen areas most in need of serious investigation and prompt implementation. The speaker lists and discusses the need for: (1) flood plain management legislation; (2) regional resource framework studies--most needed in the South; (3) early selection and acquisition of reservoir sites to avoid rising prices; (4) preservation of wild river and greenbelt areas; (5) studies of thermal-electric plant sites to minimize pollution dangers; (6) review and revision of state water laws; (7) consideration of institutional arrangements, such as river basin commissions, to provide for regional planning and resource management; (8) water quality control criteria; (9) coordination of land management with water resource and recreational programs; (10) establishment of water use priorities; (11) consideration of regional water supply and sewage treatment facilities; (12) environmental quality studies; (13) erosion and sedimentation effects of construction methods; (14) aesthetic consideration in project planning; (15) development of financing sources; and (16) the training of personnel in all water resource fields. The speaker urges strong cooperation among all local, state, and federal agencies to implement the needed water resource development progr

Identifiers: England/Wales system.

The purpose of the study was to determine th cial, economic, and health and safety impa selected recreational activities on, in, or nea terminal reservoir. A preliminary, or basic, benefit mathematical model was designed t clude consideration of these factors, and a re mended program for its extension and refine was developed. Analysis was made of the econ influence on surrounding land values of four p type reservoirs: closed, domestic supply recreational use only; multipurpose, no body tact sports; multipurpose, including body-co sports. For the three reservoirs permitting re tional use, the overall economic influenc recreational usage was estimated, and the avai data on reservoir water quality were analyze nationwide survey (48 States responding) was formed to determine policies and experience ing to recreational use of the domestic water su reservoir. Recommendations were developed coordinated, single-agency, river basin-orie water resource management suitable for na wide application based on the England/W system.

THE NUCLEAR POWER SCHEDULE STRUGGLE,
C. Olds.
Power Engineering, Vol 79, No 9, p 39-41, September 1970.

Descriptors: *Nuclear power plants, *Electric power plants, Electric power production, *Nuclear energy, Nuclear wastes, Thermal pollution, Prediction, Future planning, Economic prediction.

The future development of nuclear power electric energy production is projected for the next 7 years. It is expected that by 1975, 83 nuclear power plants will be put into operation with a total capacity of 60,600 Mwe. The problems connected with this nuclear power production growth are discussed. Stoppage seems to have increased during the past period in nuclear power plant schedules. The impact of recent emphasis on environmental problems on increasing power capabilities is noted to have contributed to what appears a power shortage for the next several years. (Vanderbilt)

MARKET FAILURES - WHY EXTERNALITIES ARE NOT ACCOUNTED FOR IN THE MARKET,
Office of the Chief of Engineers (Army), Washington, D. C. Civil Works Directorate.
Schmid.
Economics of Air and Water Pollution, Water Resources Research Center, Virginia Polytechnic Institute, Blacksburg, Va., p 29-36, Oct. 1969.

Descriptors: *Third part effects, *Resource allocation, Decision making, Institutions, Resource allocation, Public benefits, Economic efficiency.
Identifiers: *Externalities, Market mechanisms, Public goods.

Discusses public goods. Explains that environmental advantages have limits in capacity and therefore are not classic examples. Action to distribute external advantages require group decisions, public subsidy, tax measures, legal prohibitions, changes in property rights, public enterprise, or social pressure. If consumers want more natural environmental products they must be prepared to bid more, in terms of devoting more resources to this purpose. There is a point at which society must make a decision as to the cost of further improvement compared to the value of alternative investments. (See also W71-04739) (Whipple-Rutgers)

THE NATIONAL WATER COMMISSION, ANNUAL REPORT FOR 1970.
National Water Commission, Washington, D. C.

For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402 Price $0.30. Interim Report No 2, December 31, 1970. 41 p, 2 append.

Descriptors: *Planning, *Economics, *Environmental effects, *Social aspects, *Ecosystems, *Economic feasibility, Regional analysis, Resource allocation water pollution control decision making.
Identifiers: *Ecosystem response.

This is the second interim report of the National Water Commission. The first interim report outlined the organization for the task to be accomplished. At this time, only a few reports have been completed; therefore only a general idea of progress is available. Through the commissions staff, consultants, panels, and a number of contracts with universities and consulting firms, twenty-two special studies are underway. Studies are broadly classified as covering legal matters, engineering and environmental sciences, social and behavioral sciences, and forecasts. Studies of economic interest include the ecosystem's response to water manipulation, especially recycling, the value of water in its several uses, metropolitan problems including waste water management, market and administrative allocation as possible supplements to water law systems, the use of water resources to promote regional economic development, effects of water development on environment, critique of current methods of economic evaluation and a critical review of the U.S. program of water pollution control. ECONOMIC INSTITUTIONS AS SOCIAL INDICATORS,
Kentucky Univ., Louisville.
Charles R. Smith.
Paper read in the Symposium 'Emerging County Subcultural Units in Kentucky,' American Society for Ethnohistory, Ithaca, NY, Oct 24, 1969. 14 p, 4 tab, 20 ref. OWRR Project A-022-KY (7).

Descriptors: *Planning, *Social change, Social aspect, Analytic techniques, Evaluation, *Institutions.
Identifiers: *Comprehensive planning, Social system, Interdisciplinary studies, Social system, Regional development.

Traditionally social scientists have worked in the analyzation of human behavior, and not prediction of behavior. However, in an age where technological innovations are rapidly diffused into diverse cultures and sub-cultures, the necessity of planning for implementation is increasing in order to minimize the conflict between innovation and the culture involved. Social indicators could provide planners with information additional to the sophisticated system of economic indicators which allows planners to measure in one way the overall state of the economy. This approach is intended to focus attention on human problems associated with technological innovations and to provide planners with information that might enable them to implement change with a minimum of conflict. A study was made of a rural county in Kentucky to establish a position on the modernization continuum for summer of 1969. The social indicators reveal that the county is moving toward the Gesellschaft pole on the modernization continuum because of an increase in immigrant and externally owned businesses, improved transportation, and difficulty for providing employment for youth. Social indicators can be used to assess the direction of a community to permit better planning. (Wray-Chicago)

METROPOLITAN PLANNING AREA, REGIONAL ANALYSIS.
Muskegon County Metropolitan Planning Commission, Mich.

Aug 1970. 15 p, 2 pl, 2 map.

Descriptors: *City planning, Community development, Planning, *Area Redevelopment, Michigan.
Identifiers: *Metropolitan areas, Urban environment, *Muskegon, Mich.

There are two general approaches to defining a conceptual framework for regions, the geographic and the sociological. The geographic approach serves mainly to describe existing conditions and provides only limited information on the origins of regional relationships. The concept is not very productive for planning and development applications. The sociological approach provides the necessary corrective to the geographic in its emphasis on a flexible definition. In order to be successful in meeting development objectives, regions must represent the reality of a dynamic social order. Muskegan, Michigan is described, including its economy, housing, community services, institutions, transportation, recreation, and communications. Regions for development should be identified based on the particular development purpose intended. Institutional frameworks should be sought which differentiate between policy generation, program review, and effectuation. Recommendations include flexible development regions, multiple efforts to identify development potential, and formation of the West Michigan Shoreline Regional Planning Commission. (Wray-Chicago)

REGIONAL ACTION: KEY TO THE FUTURE OF SAN FRANCISCO BAY/2,
California State Water Resources Control Board, Sacramento.
Priscilla Perlman.
Water and Wastes Engineering, New York, Vol 7, No 6, p 70-73, June 1970. 2 fig, 4 ref.

Descriptors: Water quality control, Programs, *Planning, *Water management, *Pollution abatement, California.

Identifiers: San Francisco.

In part 1 of this article, the objectives and principles of this study were set forth. This part deals with the proposals for developing a water quality management program. It was found that present conventional waste water treatment methods fail to a significant degree to remove both toxicants and biostimulants. An immediate solution to present water quality problems must be found and a firm basis for maximizing future use of the water resources must be provided. With these things in mind recommendations were made to the legislature and are itemized and stated in the article. Work is under way on several of the critical studies. (See also W71-04809). (Ensign-PAI)

6C. Cost Allocation, Cost Sharing, Pricing/Repayment

THE SIMPLE ECONOMICS OF INCENTIVE CONTRACTING,
California Univ., Los Angeles.
J. J. McCall.
The American Economic Review, Vol LX, No 5, p 837-846, December 1970.

Descriptors: *Cost allocation, Risk, Economic efficiency, Probability.
Identifiers: *Incentive contracting, Fixed price contract, Target cost, Target profit.

This paper presents an economic analysis of three different kinds of government procurement contracts; namely, the fixed price contract, the fixed price incentive contract, and the cost plus fixed fee contract. From an analytical point of view, the fixed price and the cost plus fixed fee are special cases of the fixed price incentive contract. In the fixed price incentive contract, the firm establishes a target cost estimate. If actual costs are less than estimated costs, there is government sharing in the profits. Some of the previous analyses of cost estimation in government contracts has been primarily statistical. This study suggests that contractors may bias their cost estimates to conform with their profit maximizing objectives. Because of the peculiar sharing rule that characterizes these contracts, it is difficult for the government agency to distinguish between high and low-cost firms in the bases of target costs. The problem of discriminating between efficient and inefficient firms becomes less serious as the sharing proportion rises and approaches one, the fixed price contract where target costs are unambiguous indicators of the firm's expected costs. This article is relevant to water resource administrators concerned with contract standards and cost allocation. (Siegenthaler-Rutgers)

THE COSTS OF DECISION-MAKING,
Guelph Univ. (Ontario).
Alex C. Michalos.
Public Choice, Vol IX, No 3, p 39-51, Fall 1970.

Descriptors: *Decision-making, Economic evaluation, Economic efficiency, Risk, Operations research, Inventory.
Identifiers: *Cost accounting, Production costs, Implementation costs, Failure costs.

This paper constructs a system of cost accounting to be used in the evaluation of the costs of employing decision-makers and decision procedures. Distinctions were drawn among production, implementation, and failure costs. Production and implementation costs are subdivided into methods, materials, personal or overhead costs, while failure costs are subdivided into direct, indirect and estimated value losses. A comparison of the results was made with previous research. The advantage of using an inventory approach to decision-making in the future is that operations research theory becomes applicable to problems of group decision-making. This article is relevant for water administrators concerned with decision-making and project evaluation. (Siegenthaler-Rutgers)

AN ECONOMIC INTERPRETATION OF VOTING BEHAVIOR ON PUBLIC FINANCE ISSUES,
Basel Univ. (Switzerland).
Rene L. Frey, and Leopold Kohn.
Kyklos, Vol XXIII, Fasc 4, p 792-805, 1970.

Descriptors: *Decision making, *Costs, *Taxes, *Income, Economic evaluation, Government, Welfare economics, Financing, Optimization, Prices, Benefits, Social aspects, Government supports, Forecasting.
Identifiers: *Utility level, *Public goods, *Private opportunity costs, *Voting, *Public opportunity costs, Basel-Sadat.

In this paper the authors seek to analyze the voting behavior of individuals in public finance referenda. They assume that, in popular referenda, voters reveal their true preferences and the authors are thus able to analyze the individual's utility calculus. For this purpose they make use of three different cost concepts: (1) public opportunity costs, (2) private opportunity costs, and (3) expected tax increases. The authors make five hypothesis pertaining to the effect of these cost categories on the utility level of different income classes of voters and examine the determinants of the utility of public projects. The results are tested empirically, in the last part of the paper, for Basel-Sadat (Switzerland). The public good nature of water resource investments make optimal decision making difficult. Since the authors provide a measure of demand for public goods this article should be relevant to the decision process of water resource investments. (Murphy-Rutgers)

THE MARGINAL EFFICIENCY OF CAPITAL, THE INTERNAL RATE OF RETURN, AND NET PRESENT VALUE: AN ANALYSIS OF INVESTMENT CRITERIA,
Michigan State Univ., East Lansing.
James B. Ramsey.
Journal of Political Economy Vol 78, No 5, p 1017-1027, September-October 1970.

Descriptors: *Rate of return, *Economic efficiency, *Capital, *Rate of interest, Time, Costs, Investment, Economic evaluation, Price, Profit, Optimization, Equilibrium, Decision-making.
Identifiers: *Net present value, *Multiple roots, *Internal rate of return.

This paper attempts to show that the marginal efficiency of capital is not appropriate for ranking investment alternatives. This measure is an equilibrium concept and should be distinguished from the internal rate of return. The latter, when appropriately defined and used for ranking projects of equal time spans, is identifical to the ranking from net present value. It is also shown that the internal rate of return can always be calculated and has a unique value relative to the market interest rate. In the concluding section, an economic interpretation is given of the multiple roots solution of the marginal efficiency of capital and to the case where there are no real roots. The paper is relevant to the evaluation of alternative investment schemes among water projects. (Murphy-Rutgers)
W71-04460

INVESTMENT AND RATE OF RETURN FOR THE REGULATED FIRM,
American Telephone and Telegraph Co., New York.
Blaine E. Davis.
Bell Journal of Economics and Management Science Vol I, No 2, p 245-270, Autumn 1970.

Descriptors: *Utilities, *Government, *Optimization, Capital, Budget, Economic evaluation, Mathematical study, Investment, Management, Financing, Model studies.
Identifiers: *Rate of return, *Control the *Capital market, *Capital attraction capabi Market valuation.

This paper attempts to present a quantita framework showing what effect a rate of re specification can have on the structure and c position of the regulated firm's long-range inv ment decisions and the value the capital marke signs to the firm. It should be of particular inte to those concerned with the operation of pub regulated water utilities. A formulation developed for a regulated utility in terms o capital budgeting. This makes it possible for author to link the utility's investment decision (1) the method the capital market values the u ty, and (2) the restriction that rate-of-return r lation imposes on earnings. The paper dem strates that small changes in the rate of return have a dramatic impact on market valuation the firm's investment policy. (Murphy-Rutgers)
W71-04462

RESOURCE ALLOCATION WITH INCRE ING RETURNS TO SCALE,
Washington Univ., St. Louis, Mo.
Trout Rader.
American Economic Review, Vol LX, No 3, p 825, December 1970.

Descriptors: *Resource allocation, *Economic scale, *Economic efficiency, Optimization, W fare economics, Marginal costs, Prices, Budg Mathematical analysis.
Identifiers: *Consumer efficiency, *Producer ciency, Full employment, Competition, Distr tive justice.

This paper analyzes the necessary and suffic conditions for efficient allocation of resources the distribution of products. None of the usual fare conditions can be extended to the case o creasing returns to scale in one or more industr Since economics of scale are important in pu utilities, the author considers this a major defic cy of welfare economics. Since water utilities likely to have production functions exhibiting creasing returns, this paper is relevant to the w researcher. A producer efficiency is said to exi and only if: (1) industries try to maximize prod tion subject to their technology and with tradin factors allowed; (2) factors are fully employed industries minimize factor costs; (3) all factors employed and marginal rates of substitution equalized. There is consumer efficiency onl price equals marginal costs. If the output set is c vex, there is consumer efficiency if and only if tribution is competitive and GNP is maximi (Murphy-Rutgers)

THE USE OF SHADOW PRICES,
California Univ., Los Angeles.
Roland N. McKean.
In: Problems in Public Expenditure Analy Washington, D.C., The Brookings Institut 1968, p 33-77.

Descriptors: *Cost benefit analysis, *Prices, *M surement, *Economic evaluation, Governm Optimization, Welfare economics, Spillover, D sion-making, Cost minimization.
Identifiers: *Shadow prices, *Pareto optimal *Externalities, Market value, Nonmarket value.

This paper deals with the problem of measuring social costs and social benefits of a governm project. The author discusses the maximization society's welfare from Pareto optimal criteria. reasons that this can be pursued by attach prices, that accurately reflect the values of benefits to those who receive them and of the co to those responsible for their creation. Where ac rate private market comparisons cannot be ma shadow prices may be needed for accurate eval tions. However, their derivation is extremely c ficult due, in part, to the presence of externaliti In conclusion, the author states that benefit c

nalysis is an effective tool but, by itself, incapable f optimal decision-making. There is a significant otential use for shadow prices of water oriented creation activities in benefit cost justification of ater investments. This possible use plus the role of adow prices in other difficult to measure benefits akes this article relevant to water studies. Murphy-Rutgers)

N THE DISCOUNT RATE FOR PUBLIC PRO-CTS,
nceton Univ., N.J.
lliam J. Baumol.
Public Expenditures and Policy Aanlysis, 1970, 73-290.

scriptors: *Rate of discount, *Interest rate, conomic evaluation, *Costs, *Government, nomic efficiency, Social aspects, Taxes, Risk, timization, Investment.
ntifiers: *Opportunity costs, *Rate of return, ond best, Externalities.

e discount rate is of critical importance for the luation of a government project due to its ef- on the allocation of resources between the ate and public sectors of the economy. The or demonstrates that the correct discount rate a government project is the rate of return the urces could earn in the private sector. In addi- to this, taxes in the private sector should be n into account and will call for a discount rate al to the before tax rate of return in the private or. The correct social discount rate is then a hted average of the opportunity cost rate for various sectors from which the project would its resources. The author reasons that there ld be no deductions for a risk component in ates of return observed in practice but that the t of externalities in both the government and te sector be allowed for. Concluding, the r argues that it is possible to derive figures iderably more defensible than conventional ulations. This article is relevant to the analysis overnment investments in water resources. also W71-04477) (Murphy-Rutgers)

DOW PRICES FOR INCORRECT OR NON-TENT MARKET VALUES,
sylvania Univ., Philadephia.
Margolis.
d by Haveman, Robert H. In: Public Expendi- and Policy Aanalysis, 1970, p 314-329.

iptors: *Prices, *Economic efficiency, ernment, Decision-making, Costs, Cost- it analysis, Rate of interest, Land, Demand, ts, Income, Markets, Economic evaluation.
fiers: *Shadow prices, *Public goods, PPBS, costs, Productivity.

paper focuses on the analysis of how govern- assign price-like values, or shadow prices, to nputs and outputs. Because of market imper- ns, relative prices do not reflect relative costs e therefore not always a measure of relative values. Shadow prices are computed to these social values. They are usually a cor- market price for both inputs and outputs e meant to explicitly consider the opportuni- s involved. In the case of many social goods, ution is often at zero price, thus giving no measure of the correct price. The inter- e good approach, the cost savings approach e direct estimation approach are procedures ed by the author to estimate prices. The cor- formation needed to calculate shadow prices s incentives for those who make and imple- he decisions. The absence of a market for of the benefits generated from water e development necessitates the computa- f shadow prices or implicit values. Ac- ly, this paper is relevant to the water her engaged in the estimation of social and benefits derived from water investments. so W71-04477) (Murphy-Rutgers)

PUBLIC BEACH, CITY OF NEW YORK, V WEST TENTH ST REALTY CORP (DISPUTE OVER SUBMERGED OCEAN LAND).

256 NY 222, 176 NE 173-174 (1931).

Descriptors: *New York, *Land tenure, *Riparian land, *Avulsion, Condemnation, Eminent domain, Compensation, Condemnation value, Real property, Legal aspects, Judicial decisions, High water mark, Boundaries (Property), Boundary disputes, Land, Ownership of beds.

Plaintiff public beach sought to condemn defendant's ocean front property. A portion of the land lay below the high water mark, having been formerly submerged by avulsion. Plaintiff contended that defendant did not own this portion, since his deed read 'to the Atlantic Ocean.' Defendant contended that his land included this strip, since a predecessor's conveyance was to the high water mark at the date. Noting that in the absence of a contrary intent, the grantor is presumed to have conveyed all he owned, not reserving the fee of submerged lands, the Court of Appeals of New York held that defendant's title extended past the present high water mark to include the avulsion. LUND V COX (ACTION TO QUIET TITLE AGAINST BATHING EASEMENT).
281 Mass 484, 183 NE 714-717 (1933).

Descriptors: *Massachusetts, *Easements, *Land tenure, *Boundary disputes, Boundaries (Property), Beaches, Swimming, Right-of-way, Judicial decisions, Legal aspects, High water mark, Low water mark, Recreation.

Plaintiff sought to quiet title free of incumbrances to beachfront property to which he held legal title. Defendant contended that she held bath-house and bathing privileges under a prior grant. Defendant contended that the grant of an easement in the 'beach' gave her rights in the property between high and low water marks. The Supreme Judicial Court of Massachusetts, in affirming a judgment for plaintiff, stated that in a deed passing title 'northerly by the sea,' the boundary would run along the low water mark. The court further stated that 'beach,' as used in the deed granting bathing privileges, meant the land above the high water mark, rather than the area between high and low water marks. (Hart-Florida)
W71-04443

NIAGARA FALLS POWER CO V WATER POWER AND CONTROL COMM'N (JUDICIAL REVIEW OF POWER COMMISSION'S RENTAL AWARD FOR WATERS OF NAVIGABLE RIVER).
267 NY 265, 196 NE 51-57 (1935).

Descriptors: *New York, *Administrative decisions, *Rent, *Hydroelectric plants, Hydroelectric project licensing, State governments, Legislation, Federal government, United States, Navigable rivers, Navigation, Dams, Diversion dams, Diversion, Treaties, Hydroelectric power, Administrative agencies, Judicial decisions, Legal aspects, Adjudication procedure, Permits.

Plaintiff power company sought review of defendant state commission's order fixing an annual rate of $5 per horsepower for water diverted from a navigable river. The statute permitting plaintiff to divert water reserved to the state the right to charge an equitable rental. Plaintiff contended that the rental was excessive. The Court of Appeals of New York noted that: (1) whether the river was navigable at the diversion point was immaterial for commerce purposes, since a river navigable in part is navigable in whole; (2) plaintiff was subject to congressional regulation of navigation; (3) Congress and the state have joint control of the public interest in the river; and (4) the statute permitted the state to charge rental for use of the water, not merely an administrative charge. The court observed that plaintiff was bound by the statute giving the state the right to charge an equitable rental. Since defendant had taken evidence bearing upon the reasonable rental value of the water diverted by plaintiff, there was no evidence that defendant's order was arbitrary. (Hart-Florida)
W71-04445

CLEVELAND, CC AND ST L RY V MUMFORD (ASSESSMENT OF RAILROAD FOR EXPENSES OF BUILDING LEVEE).
197 NE 826-837 (Ind 1935).

Descriptors: *Indiana, *Levees, *Railroads, *Assessments, Compensation, Eminent domain, Condemnation, Payment, Bridges, Floods, Navigable rivers, Rivers, Federal government, United States, Flood protection, Dikes, Shore protection, Judicial decisions, Legal aspects, Drains, Governments, State governments, Navigation, Flood control, Taxes.

Plaintiff railroad company brought action to prevent construction of a levee. Several rivers frequently overflowed, and defendant riparian landowner petitioned for construction of the levee, which would force plaintiff to rebuild its track in the affected area. Furthermore, plaintiff was to be assessed for benefits derived from the levee. Plain-

tiff contended that damages should be allowed for its rebuilding expenses. The Supreme Court of Indiana stated that: (1) congressional approval was not required to construct the levees, since federal control extended only to the channel of navigable streams; (2) plaintiff's property was subject to the state police power to construct levees for public benefit; (3) plaintiff must conform its bridges and tracks to the levees without compensation; (4) requiring plaintiff to rebuild was not a fifth amendment taking of property; (5) plaintiff could be assessed for any special benefit exceeding community benefit; (6) whether plaintiff's property was specially benefited was a fact question; and (7) if plaintiff received no special benefits, assessment would be a fifth amendment taking. Although determing that plaintiff could not recover rebuilding expenses, the court held that plaintiff could not be assessed except for special benefits exceeding rebuilding expenses. (Hart-Florida)
W71-04464

CRAGE V CITY OF BUFFALO (DISCHARGE OF SEWAGE INTO CANAL AS NUISANCE).
6 NE2d 607 (1937).

Descriptors: *New York, *Sewage, *Water pollution, *Canals, Sewage disposal, Domestic wastes, Water pollution sources, Legal aspects, Judicial decisions, Waste disposal, Disposal.

Plaintiff's land was contiguous to defendant's canal. The sewers from plaintiff's land as well as from that of others discharged into the canal. After diverting his own sewage from the canal, plaintiff sued, contending that the sewage discharge was a nuisance. The Court of Appeals of New York held that: (1) plaintiff took possession of the premises knowing of the sewage discharge, (2) that neither plaintiff nor his predecessors had any right to discharge sewage into the canal, and (3) that plaintiff had created a great part of the nuisance. Accordingly the decree of the lower court dismissing the complaint was affirmed. (Hart-Florida)
W71-04490

BLATCHFORD V VOSS (DISPUTES OVER SUPREMACY OF MEANDER OR PLAT LINE).
219 NW 100-102 (Wis 1928).

Descriptors: *Wisconsin, *Land tenure, *Boundary disputes, *Meanders, United States, Riparian land, Lakes, Boundaries (Property), Shores, Real property, Legal aspects, Judicial decisions, Land.

Plaintiff riparian landowner brought ejectment against defendant riparian landowner. Defendant owned two lots, one north of plaintiff's and another west of plaintiff's. A small lake inlet extended through defendant's west lot and into plaintiff's lot. Plaintiff claimed land north of the inlet within the northern plat line of defendant's west lot. Plaintiff asserted that since the government survey showed a meander line as his west boundary, he was entitled to all the land extending to the actual water line. The Supreme Court of Wisconsin stated that in conveyance from the United States, the water line, rather than the meander line, is the true boundary. However, if there is no water nearby, this rule is inapplicable. Determining that when there is a conflict, meander lines are subordinate to section lines, the court held that plaintiff's lot could not extend past the section line since the water was distant from the meander line and defendant's plat line was paramount. (Hart-Florida)
W71-04520

EAST BAY SPORTING CLUB V MILLER (RIGHT OF PUBLIC TO USE PRIVATE WILDLIFE-MANAGEMENT LANDS ON LAKE ERIE).
118 Ohio St 360, 161 NE 12-16 (1928).

Descriptors: *Ohio, *Lake Erie, *Fishing, *Navigable waters, Fish management, Recreation, Fish conservation, Lakes, Bays, Watercourses (Legal), Intermittent streams, Judicial decisions, Marshes, Wildlife conservation, Wildlife, Wildlife habitats, Wildlife management, Legal aspects.

Plaintiff sporting club brought action to enjoin defendant citizen from hunting and fishing upon its lands. The disputed lands were primarily marshes. Defendant asserted the right to hunt and fish the lands as a member of the public and asserted that deprivation of such right was unconstitutional. The Supreme Court of Ohio noted that: (1) the public is entitled to fish in Lake Erie and its open bay regardless of whether such waters are navigable, (2) waters capable of use as highways for commerce are navigable, and (3) a 'watercourse' is a stream in a natural channel discharging into a larger body of water. Since part of the disputed land was part of a bay of Lake Erie, the court held that defendant was entitled to fish that portion. However, since plaintiff established ownership of the remaining land, which was not part of Lake Erie, the court enjoined defendant from trespassing upon the remainder. (Hart-Florida)
W71-04529

CITY OF NORWOOD V SHEEN (DAMAGES FOR SEWAGE DISCHARGE ONTO PRIVATE PROPERTY).
183 NE 177 (Ct App Ohio 1932).

Descriptors: *Ohio, *Sewage disposal, *Sewers, *Eminent domain, Damages, Cities, Land, Land tenure, Judicial decisions, Legal aspects, Adjudication procedure, Water pollution, Sewage, Overflow, Compensation, Eminent domain, Discharge (Water), Waste disposal.

Plaintiff executor of decedent's estate brought suit for damages against defendant city for appropriation of property. Defendant had taken over a sewer and allowed sewage to flow upon decedent's property during decedent's lifetime. Plaintiff contended that this amounted to appropriation of decedent's property. Defendant claimed that, if any cause of action existed, it existed by reason of the creation of a nuisance and the right of action abated on the death of decedent. The trial court returned a verdict for plaintiff and the Court of Appeals of Ohio affirmed. The act of the city permitting sewage to flow over decedent's land constituted an appropriation for such use. The disposal of sewage is a governmental function which may amount to appropriation requiring compensation to the damaged party. Defendant's contention that the act was only actionable on the theory of nuisance was incorrect. (Duss-Florida)
W71-04532

BARNES V PECK (ADDITIONAL USE OF WATER RIGHTS CONDEMNED FOR AUGMENTATION OF CITY WATER SUPPLY).
187 NE 176-182 (Mass 1933).

Descriptors: *Massachusetts, *Water supply, *Eminent domain, *Water rights, Damages, Compensation, Water utilization, Administrative agencies, Easements, Rivers, Streams, Land, Legislation, Domestic water, Construction, Cities, Waterfalls, Electric power, Reasonable use, Legal aspects, Judicial decisions, Adjudication procedure, Condemnation, Hydroelectric power.

Plaintiffs sought to invalidate the taking of land by defendant city and defendants claiming through the city. The land was taken to increase the city's water supply. Plaintiffs contended that the taking of land and water rights was illegal in that: (1) the state statute authorizing the taking was not complied with, and (2) the city exceeded its rights in the water by using it to generate electricity for sale. Plaintiffs had been awarded damages for the taking but had refused them. The lower court dismissed plaintiffs' actions and the Supreme Judicial Court of Massachusetts affirmed. All of plaintiffs' constitutional and statutory rights were protected and complied with by the city in the taking. The city did not exceed its water rights by generating and selling electricity. The statutory authority for the taki
the water encompassed uses other than the
cipal one of increasing the water supply. The
development of electricity was incidental t
main purpose of increasing its water supply an
therefore within the statute authorizing th
creased water supply. (Duss-Florida)

MEND THE WATERSHED PROTECTION ND FLOOD PREVENTION ACT.
earings, Subcomm on Conservation and Credit, omm on Agriculture, US House of Reps, 89th ong, 1st Sess, Oct 11, 1965, p 69-82.

escriptors: *Legislation, *Watershed Protect. and ood Prev. Act, *Multiple-purpose projects, Water utilization, Watersheds (Basins), Water pply, Dams, Flood protection, Flood control, ildlife management, Reservoirs, Cities, Manage-ent, Recreation, Fish management, Irrigation ter, Water management (Applied), Wildlife, oodwater, Upstream reservoir sites, Reservoir orage, Project benefits, Cost-benefit analysis, sts, Acreage.
ntifiers: *Floodwater detention capacity.

arings before the Subcommittee on Conserva-n and Credit of the House Committee on riculture were held for the purpose of consider-amendments to the Watershed Protection and od Prevention Act. Considered were H.R. 2468, . 4812, H.R. 5149, H.R. 9149, H.R. 9917, and . 10241--all of the 89th Congress, first session. Watershed Protection and Flood Prevention limited the size of dams to a flood-detention acity of 5000 acre-feet. At the same time it al-ed a 25,000 acre-feet capacity for reservoirs n which water was available for municipalities, and wildlife development, irrigation, and reation. Unless the dams were located upstream re water supply was inadequate to permit mul-e-purpose development it was impossible for small dams to hold back sufficient floodwater the full allowable reservoir capacity of 25,000 . The amendments considered increased the tation on floodwater detention capacity from 0 to 12,500 acre feet, thereby providing for the utilization of available reservoir sites for multi-purposes. Moreover, increasing the limitation loodwater detention capacity to 12,500 acre-would also result in reduction of overall pro-costs and increase the benefits in some rsheds. ERSHED PROJECTS.

ings, Subcomm on Conservation and Credit, m on Agriculture, US House of Reps, 89th , 1st Sess, March 16, 17, July 20, 22, Aug 30, 21, 22, Oct 11, 1965. 253 p.

riptors: *Flood protection, *Watersheds ns), *Flood control, *Legislation, Project pur-, Project planning, Watershed management, nel improvement, Stream improvement, Crop ction, Federal government, Local govern-, State governments, Financing, Public lands, use, Flood damage, Cost-benefit analysis, lination, Structures.

ngs before the Subcommittee on Conserva-and Credit of the House Committee on lture were held to consider watershed pro-ubmitted and recommended by the Depart-f Agriculture. States in which projects were located included: Alabama, Arkansas, a, California, Florida, Indiana, Iowa, Kansas, ana, Mississippi, Nebraska, Nevada, New , New Mexico, North Carolina, North a, Ohio, Oklahoma, Pennsylvania, South na, Tennessee, Texas, Utah, Vermont, Vir-West Virginia, and Wisconsin. The purpose e projects was primarily flood prevention. In f the districts where cropland predominated ther watershed land uses, there was con-le flood damage, resulting in high produc-sts and low crop yields. In general, flooding uted to overall underdevelopment in the eds and surrounding communities. There-here was a need for assistance from the government to the various districts in order to prevent such flood damage. Many projects demonstrated cooperation between the federal government, state governments and local governments, with reference to financing and planning. (See also W71-04641) (Duss-Florida)

A BEGINNERS GUIDE TO RESEARCH IN NATURAL RESOURCES LEGISLATION AND POLICY DEVELOPMENT,
Central Washington State Coll., Ellensburg.
K. A. Hammond, and Carolyn Willberg.
December 1969. 54 p, 6 ref. OWRR Project B-019-WASH (3).

Descriptors: *Natural resources, *Legislation, *Publications, *Information retrieval, Methodology, State governments, Federal government, Legal aspects, Judicial decisions, Local governments, Water resources development, Political aspects, Administrative agencies, Washington, Data collection, Research and development, Bibliographies, Conferences, Documentation, Libraries, Technical societies.
Identifiers: *Legislative history, *Public policy.

Designed as a manual for student use, this guide provides an approach to research in natural resources legislation and policy development. The guide is suited to researching specific legislation as well as general topics and points out that political bias must be considered in researching legislative history. At the federal level, the manual presents guides for tracing the history of bills and resolutions from their introduction through committee hearings and reports to congressional debate and enactment. Use of the Congressional Record is examined, and procedures for locating and obtaining legislative documents are outlined. The manual also examines the use of statutes, executive documents, general reference sources, agency publications, and publications of private interest groups. Part II covers resources legislation at the state level, where documentation is often incomplete or nonexistent. Much state material is never documented or published; therefore, specific information requests and interviews are primary sources of material in state research. Using the state of Washington as an example, the manual discusses sources dealing with legislative history, statutes, judicial decisions, attorney general's opinions, legislative reviews, municipal ordinances and voting information. (Liptak-Florida)

PERMITS FOR DISCHARGES OR DEPOSITS INTO NAVIGABLE WATERS.
Corps of Engineers, Washington, D.C.

Federal Register, Vol 36, No 14, Thursday, January 21, 1971, p 983-984.

Descriptors: *Water quality control, *Permits, *Rivers and Harbors Act, *Administrative decisions, Navigation, Waste disposal, Navigable waters, United States, Water quality, Public health, Water pollution, Water pollution sources, Water resources, Legislation, Water pollution abatement, Administration, Administrative agencies, Decision making, Water policy, Effluents, Wastes, Regulation, Waste water (Pollution).
Identifiers: *Environmental Policy Act, *Corps of Engineers.

In recognition of the duties of the Secretary of the Army under the Refuse Act of 1899 and of the responsibilities of the Environmental Protection Agency (EPA) under the National Environmental Policy Act of 1969, the Secretary proposed a memorandum of understanding between the Secretary and the EPA to guide the Corps of Engineers in implementing the Refuse Act permit program. The Corps' policy will be to coordinate with the EPA all applications for permits to discharge refuse into navigable waters. The EPA will advise the Corps of the impact of the proposed discharge on water quality standards and the EPA's findings will be conclusive. The memorandum establishes procedures for application, state certification under the Federal Water Pollution Control Act, and guidelines to be considered by the EPA in processing applications. In the absence of objection from the EPA, the Corps may deny a permit only if it impairs navigation or adversely affects fish and wildlife resources under the meaning of the Fish and Wildlife Coordination Act. The Corps will also consult the EPA before adopting rules, regulations, policies, or procedures under the Refuse Act or relating to the memorandum. Permits shall require compliance with applicable water quality standards, provide for suspension or revocation for non-compliance or changed conditions adversely affecting water quality standards, permit inspection and sampling, and provide for periodic reports on the nature and quantity of refuse discharged. (Liptak-Florida)
W71-04646

FINANCIAL RESPONSIBILITY FOR OIL POLLUTION CLEANUP.
Federal Maritime Commission, Washington, D.C.

Federal Register, Vol 36, No 14, Thursday, January 21, 1971, p 996-997.

Descriptors: *Ships, *Oil, *Administrative decisions, *Insurance, Water pollution control, Pollution abatement, Federal government, United States, Water pollution, Water quality control, Water pollution sources, Legislation, Administration, Administrative agencies, Decision making, Legal aspects, Risks, Compensation, Damages, Adjudication procedure, Remedies.
Identifiers: *Oil spills, *Water Quality Improvement Act.

In order to implement the financial responsibility provisions of section 11 (p) (1) of the Federal Water Pollution Control Act, the Federal Maritime Commission adopted regulations requiring owners of vessels exceeding 300 gross tons to evidence their financial responsibility to meet potential liability to the United States resulting from oil discharges in United States' waters. The Act permits direct action against the insurer or underwriter and allows the insurer to raise all defenses the owners could have raised. To implement this provision, the Federal Maritime Commission regulations set out a uniform policy endorsement, certificate of insurance, surety bond form, and guarantee form in which the insurer agrees to direct action. Upon the objection of several underwriters that the language of the standard forms was subject to possible misinterpretation regarding the extent of rights and defenses available to the insurer, the Commission gives notice of proposed adoption of clarifying language in the regulations. The changes will make the new language optional with the insurer, and the Commission may accept either the original or alternative language. (Liptak-Florida)

SOME RECENT DEVELOPMENTS CONCERNING FISHING AND THE CONSERVATION OF THE LIVING RESOURCES OF THE HIGH SEAS,
California Univ., San Diego. Inst. of Marine Resources.
Milner B. Schaefer.
San Diego Law Review, Vol 7, No 3, p 371-407, July 1970. 106 ref.

Descriptors: *Marine fisheries, *Conservation, *International law, *International waters, Law of the sea, Legal aspects, Treaties, Continental Shelf, Marine animals, Marine fish, Commercial fishing, Oceans, Exploitation, United States, Foreign countries, United Nations, International commissions, Navigation, Aquatic life, Crustaceans, Fish, Fish conservation, Beds.
Identifiers: *Territorial seas.

Discussing current developments concerning fishing and conservation of living resources in the high

seas, this article focuses upon the problems of the present international legal framework and the recent activities of nations in international fishery affairs. Particular emphasis is given to the practice and policy of the United States. The present legal framework is made up of the four conventions adopted at the 1958 International Conference on the Law of the Sea. These conventions concern: (1) the high seas, (2) the territorial sea and the contiguous zone, (3) the Continental Shelf, and (4) fishing and conservation of living resources of the high seas. The author notes that these conventions are inadequate in that they do not: (1) establish limitations on the use of resources, (2) specify who is to have access to resources on the high seas, (3) specify who should prescribe policies regarding access, and (4) establish procedures whereby disputes over policies may be settled. The convention on Fishing and Conservation is particularly weak because few nations have ratified it. Regarding recent developments, the author discusses nations' claims of exclusive jurisdiction over living resources in coastal waters and in Continental Shelf waters. Current problems in what constitutes conservation of resources are considered. Finally, the author examines methods employed in settling disputes between nations and proposals for a more uniform system in the future. (Duss-Florida)

THE THEORY AND PRACTICE OF INTERNATIONAL FISHERY DEVELOPMENT-MANAGEMENT,
Ralston Purina Co., St. Louis, Mo.
Wilbert McLeod Chapman.
San Diego Law Review, Vol 7, No 3, p 408-454, July 1970. 83 ref.

Descriptors: *Marine fisheries, *Fish conservation, *International commissions, Law of the sea, *International law, Fish management, Fisheries, United Nations, Treaties, Exploration, Exploitation, Technology, Economics, Regulation, Oceans, Commercial fisheries, Fish behavior, Migration patterns, Research and development, Fish populations, Environment, Environmental effects, Seas, Legal aspects.

Because of the rapid development of the marine fishing effort on a world-wide basis, the author of this article sees a great need for marine fish conservation and management. The article focuses upon the present international machinery for fishery regulation and seeks to assess its efficacy--whether it needs strengthening or whether an entirely new international framework should be established. Among the existing international fishery commissions and bodies discussed are: (1) the International Commission for the Exploitation of the Sea; (2) the Fur Seal Convention; (3) the International Pacific Halibut Commission and similar conventions; (4) the International Whaling Commission; (5) the Indo-Pacific Fisheries Council, and the Food and Agriculture Organization of the United Nations; (6) the International Commission for the Northwest Atlantic Fisheries; (7) various restrictive fishery conventions; and (8) various fishing-rights agreements between nations. The author emphasizes the importance of scientific analysis of fish populations in the area of conservation. He concludes that existing organizations have contributed much in the way of mitigating disputes between nations and improving our knowledge of the ocean, its resources, and fishing. However, the author does see the need for a major overhaul of the United Nations machinery for dealing with ocean-oriented problems. There is particular need for improved funding of scientific research into fishing problems. (Duss-Florida)

INTERNATIONAL AND NATIONAL REGULATION OF POLLUTION FROM OFFSHORE OIL PRODUCTION,
Nospaman, Waters, Scott, Krueger and Riordan, Los Angeles, Calif.
Robert B. Krueger.
San Diego Law Review, Vol 7, No 3, p 541-573, July 1970. 33 p, 138 ref.

Descriptors: *Water pollution, *Oil industry, *Offshore platforms, *Exploitation, Legislation, Oil wells, International law, International waters, Natural gas, Oil, Oil fields, Exploration, Water pollution sources, Water pollution effects, Water pollution control, Pollutants, Pollution abatement, Administrative agencies, Water Quality Act, Legal aspects, Regulation.
Identifiers: Outer Continental Shelf Lands Act, Oil spills.

The petroleum resources available on the Continental Shelf and their relation to world supply are examined by this article to show that exploitation of offshore petroleum is necessary. The author discusses in detail the various international conventions establishing agreements between riparian nations to pevent oil pollution. President Nixon proposed to the United Nations that all nations adopt a treaty renouncing claims over natural resources of the seabed beyond the point where the high seas are 200 meters deep and agree to regard these resources as the 'common heritage of mankind.' The author analyzes considerations for and against the President's proposal, pointing out that underdeveloped nations are relatively unconcerned about pollution. It is also suggested that pollution from offshore wells is not nearly so disastrous as a wrecked oil tanker, such as the Torrey Canyon. The author concludes that techniques are available and can be developed which would greatly reduce any chance of spillage from offshore wells. In addition, the Outer Continental Shelf Lands Act, the Water Quality Improvement Act, and the National Environmental Improvement Act are examined as means of preventing pollution. (Hart-Florida)

OCEAN POLLUTION: AN EXAMINATION OF THE PROBLEM AND AN APPEAL FOR INTERNATIONAL COOPERATION,
Douglas D. Busch, and Edward I. Mears.
San Diego Law Review, Vol 7, No 3, p 574-604, July 1970. 31 p, 94 ref.

Descriptors: *Oceans, *Water pollution, *Water pollution control, *International waters, International law, International commissions, Pollution abatement, Water pollution sources, Water pollution effects, Estuaries, Water pollution treatment, Pollutants, Public health, United States, Foreign waters, Thermal pollution, Non-structural alternatives, Oil, Oily waters, Pesticides, Pesticide residue, Pesticide drift, Pesticide removal.
Identifiers: *International cooperation, *Ocean pollution.

Emphasizing that man's survival depends upon the oceans, this article notes that man can no longer ignore ocean pollution. The impact of pollution upon estuaries and the high seas is considered first, wherein the author notes that many marine organisms depend upon clean estuaries during part of their life. Marine pollution is next considered. The author discusses in detail specific pollutants, sources, and the effects of pesticides and petroleum. The analysis of sources includes an examination of the polluting effects of man's land activities, man's surface activities, and man's exploitation of sea resources. To solve the ocean pollution, there is a need for international cooperation. Present treaties are inadequate, and United Nations regulation of international pollution is difficult. The problem of defining what pollution is to be abated on an international level is examined. Whether regional or international control would be a better method of pollution control is briefly considered. The author concludes with fourteen recommendations for controlling ocean pollution. (Hart-Florida)

TWO NEGLECTED PROBLEMS IN DRAFT REGIMES FOR DEEP OCEAN RESOURCES
American Journal of International Law, Vol 64 5, p 905-919, Oct 1970. 50 ref.

Descriptors: *Water resources development, of the sea, *International law, *Oceans, L aspects, International commissions, Contin Shelf, Resources, Regulation, Ownership of b Exploitation, Exploration, United Nations, T ties, Mineralogy, Relative rights, Beds under wa
Identifiers: Ocean resources.

Considering two essential yet neglected legal spects of proposals for international regimes to overn deep-ocean resources, the author of this arcle discusses: (1) the legal quality of title that a ate may have over deep-ocean resources, and (2) eans of assuring transnational recognition of title deep-ocean resources. To illustrate these points, e author critically evaluates the Stratton Comission Report which sought to redefine the Conental Shelf, establish intermediate zones beyond e shelf, and establish an international framework r registering claims to resources and for financing search and development of resources. The chief oblem with the quality of title under the Commisn's registry authority is that it adopts a 'firstme, first-registered' system and is not so much a ims-registration regime as a mere recording one. for transnational recognition of title, the Comssion failed to specify whether it favored a full-th-and-credit or national treatment of foreign ti-. A model developed from analogies to the quirements of recognition of perfected security erests under the Uniform Commercial Code ght be preferable to either system. (Duss-rida)

WHOLESALE LAUNDRY BD OF TRADE, INC V CITY OF NEW YORK (CONSTITUTIONALITY OF INCREASED WATER RATES).
315 NYS2d 715-717 (Sup Ct 1970).

Descriptors: *New York, *Water rates, *Administrative decisions, *Local governments, Public utilities, Water supply, Cities, Regulation, Administrative agencies, Administrative decisions, Water users, Utilities, Legal aspects, Judicial decisions, Costs.

Plaintiff laundry corporations sought to restrain defendant city from enforcing increased water rates promulgated by the Administration of Environmental Protection and approved by the Board of Estimate. The state constitution provided that local government may make a fair return on the value of property used in the operation of public utilities. Profit was allowed in addition to the cost of service and taxes which would be paid to local governments if the service were privately owned. Plaintiffs contended that the proposed increase would give the city an excessive return. Defendant alleged that the increase would not bring about an excessive return. The Supreme Court of New York County granted defendant summary judgment. The return on the city's investment would not exceed the fair legal rate of return as set by the Banking Board. (Duss-Florida)

FRIEDLAND V STATE (LIABILITY OF STATE FOR ALTERING FLOW OF STREAM).
314 NYS2d 935-938 (Sup Ct App Div 1970).

Descriptors: *New York, *Surface waters, *Alteration of flow, *Reasonable use, Diversion, Relative rights, Riparian rights, Streamflow, Watercourses (Legal), Riparian land, Surface runoff, Rainfall, Highways, Construction, Ponds, Flow, Natural flow doctrine, Land, Land tenure, Percolating water, Surface drainage, Channels, Damages, Judicial decisions, Legal aspects.

Plaintiff landowners sought damages from defendant state for interference with a stream which fed a pond on plaintiffs' land. Defendant had constructed a highway, thereby diverting and rechanneling the stream which passed through plaintiffs' property. Plaintiffs contended that these acts so altered the discharge of surface water that, depending on the amount of rainfall, algae formed in the pond or the pondwater became stagnant. The Supreme Court of New York reversed a lower court decision for plaintiffs. The court applied several principles of law to the facts of this case, including: (1) the right of a landowner to divert streams flowing through his land so long as they are returned to their normal channel before reaching land of lower owners, (2) liability for willful diversion of water onto neighboring land, (3) the equal rights of upper and lower riparian owners to deal with surface waters on their property, (4) the amount of surface water which may be discharged into a natural watercourse after construction of municipal improvements, and (5) the right of a landowner to reasonably use percolating waters on his land. Applying these principles the court found that the record did not sustain liability on the part of the state. (Duss-Florida)

OWEN V HUBBARD (BOUNDARY DISPUTE OVER TITLE TO BULKHEAD).
271 A2d 672-682 (Ct App Md 1970).

Descriptors: *Maryland, *Boundary disputes, *Riparian rights, *Bulkheads, Navigable waters, Relative rights, Land, Riparian land, Property (Boundaries), Permits, Easements, Channels, Legislation, High water mark, Banks, Shores, Accretion (Legal aspects), Construction, Tidal waters, Riparian waters, Legal aspects, Judicial decisions, Adjudication procedure, Remedies.

Plaintiff riparian landowners sought a declaratory judgment determining title to a portion of a bulkhead constructed by defendant adjacent riparian landowners. Defendants constructed the entire bulkhead with plaintiffs' consent, and plaintiffs contended that their consent extended to construction of a leg of the bulkhead along their riparian property. Defendants contended that the boundary between the two properties showed that they did not construct any part along a riparian course owned by plaintiffs, and that, even if they had, plaintiffs' mere side rights should not prevail over defendants' right to use and possess the improvements they erected. The Court of Appeals of Maryland affirmed a lower court's decree for plaintiffs. A permanent easement for use and enjoyment of the bulkhead was granted defendants. Though the evidence was conflicting, the trial court's determination that plaintiffs' land behind the disputed bulkhead was riparian was not clearly erroneous. A Maryland statute grants riparian owners the exclusive right to make improvements into waters fronting their land. This statute is not susceptible to a construction prejudicing riparian rights where improvements are made on the side of riparian land. Title to that portion of the bulkhead extending in front of plaintiffs' land was thus in plaintiffs. (Duss-Florida)

KENNY CONSTRUCTION CO V METROPOLITAN SANITARY DIST (SANITARY DISTRICT'S NONLIABILITY FOR CONSTRUCTION COSTS IN EXCESS OF CONTRACT).
262 NE2d 842-850 (Ct App Ill 1970).

Descriptors: *Illinois, *Contracts, *Construction costs, *Sewers, Adjusted costs, Claims (Contracts), Change orders, Negotiations, Engineers estimates, Bids, Performance, Specifications, Contract administration, Drainage programs, Administration, Materials, Subsurface waters, Drainage systems, Tunneling, Sanitary engineering, Subsoil, Legal aspects, Judicial decisions, Construction materials. Identifiers: *Sanitary districts.

Plaintiff construction company sought recovery of additional costs incurred in sewer construction for defendant sanitary district. During construction plaintiff encountered allegedly unforeseen subsurface water. Plaintiff obtained defendant's written approval of certain changes in construction methods and material, but failed to obtain the contractually required written consent to treat such work as 'extra' and to submit written claims for extra costs within thirty days. Defendant appealed the trial court's award of recovery to plaintiff. Plaintiff, contending defendant's actions constituted waiver of the contractual requirements, cross-appealed, denying the adequacy of its award. The Appellate Court of Illinois held that the sanitary district's approval of changes in sewer construction methods and material did not constitute waiver of contractual conditions requiring written consent to extra costs for unauthorized work due to allegedly unforeseen subsurface conditions. Finding the plaintiff had been forewarned of possibly adverse subsurface conditions by both the contract and bid proposal, the court ruled the defendant not liable for plaintiff's extra costs. The lower court's award to plaintiff was reversed. (Earl-Florida)

HENRY B BYORS AND SONS, INC V BOARD OF WATER COMM'RS (VALIDITY OF CHARGES IMPOSED AS A PRECONDITION TO MUNICIPAL WATER SERVICES).

264 NE2d 657-664 (Mass 1970).

Descriptors: *Massachusetts, *Water demand, *Water pressure, *Water rates, Water costs, Water supply, Contracts, Water distribution (Applied), Water conveyance, Distribution, Domestic water, Institutional constraints, Permits, Installation costs, Administration, Administrative agencies, Land tenure, Public utilities, Legal aspects, Judicial decisions.

Plaintiff plumbing subcontractor sought a judicial determination of the validity of, and liability for, a charge imposed by defendant municipal water commissioners as a condition precedent to providing water services. The charge was imposed to meet the costs of maintaining adequate water pressure and supply in light of the cumulative effect of new construction. Plaintiff contended the charge was unauthorized, unreasonable and discriminatory, and denied liability under a contract requiring him to pay all necessary costs. Defendants asserted that such a 'demand charge' was within their statutory authority. The Supreme Judcial Court of Massachusetts held that: (1) municipal water commissioners have the authority to demand a charge before allowing connections into a municipal water main; (2) water charges need not be based entirely on the amount of water used; (3) reasonable discretion may be exercised in determining the terms of an extension of municipal water lines; (4) absent controlling contractual stipulations, a property owner is liable for water service and related charges. The court decreed the defendants' charge to be reasonable and valid. However, the property owner and not plaintiff subcontractor was liable for the payment of the charge. (Earl-Florida)

SISSELMAN V SMITH (AUTHORITY OF COAST GUARD TO ISSUE BRIDGE-CONSTRUCTION PERMITS).
432 F2d 750-755 (3rd Cir 1970).

Descriptors: *United States, *Bridge construction, *Permits, *Legislation, Federal jurisdiction, Administrative agencies, Administration, Administrative decisions, Federal government, Navigation, Navigable waters, Canals, Navigable rivers, Adjudication procedure, Decision making, Coast Guard regulations, Institutional constraints, Construction, Legal aspects, Judicial decisions.
Identifiers: *General Bridge Authority Act.

Plaintiff canal owners, on grounds of impairment of navigation, sought to block the issuance of bridge construction permits by defendant Coast Guard commandant. Plaintiffs' canal had been constructed under legislation reserving in Congress the right to alter its navigable use. Defendant issued the permits pursuant to the General Bridge Authority Act of 1946. Plaintiffs contended that, in light of Congresses' reserved authority under the prior statute, defendant was without authority to issue the permits. The Third Circuit Court of Appeals held that the General Bridge Authority Act was intended to end piecemeal congressional supervision of bridge construction under prior legislation and, absent contrary language in pertinent statutes, there is no right to cross examination or notice in proceedings for the issuance of bridge permits by the United States Coast Guard. Determining that sufficient evidentiary support existed to uphold the defendant's determination that the alleged impairment to navigation was more theoretical than real, the court ruled that the power reserved to Congress by the prior statute had been delegated to the defendant. Summary judgment in favor of defendant affirmed. (Earl-Florida)

UNITED STATES V TANKER MONSOON (RECOVERY FOR WRONGFULLY IMPOSED OIL POLLUTION CLEAN-UP COSTS).

433 F2d 95-98 (1st Cir 1970).

Descriptors: *Oil, *United States, *Water pollution, *Ships, Pollution (Stream), Stream pollution, Oily water, Navigable waters, Navigable rivers, Admiralty, Federal government, Harbors, Water pollution sources, Pollutants, Pollution abatement, Judicial decisions, Legal aspects, Legislation, Remedies.
Identifiers: *Oil Pollution Act, *Oil spills.

Plaintiff oil tanker sought recovery of oil-clean-up expenses incurred after the United States libeled her and charged her with violation of the Oil Pollution Act of 1924. Evidence at trial established that the tanker had not caused the pollution. Plaintiff alleged that the government's negligence in charging her entitled her to recovery of clean-up costs. The United States denied negligence, asserted governmental immunity, and denied the imposition of a penalty or the receipt of money. The United States Circuit Court of Appeals for the First Circuit held that where the government negligently charges a tanker with pollution and demands she clean up oil spillage or be billed for the government's expense, the tanker electing to clean up is entitled to recovery of her costs under the Tucker Act, as a penalty wrongfully exacted by the government. The court determined that there was no probable cause to charge the plaintiff, and governmental tort immunity did not apply since a negligent lawsuit is not a tort. (Earl-Florida)

CAROLINA BEACH FISHING PIER, INC V TOWN OF CAROLINA BEACH (ALLEGED TAKING OF LITTORAL LANDOWNER'S PROPERTY FOR CONSTRUCTION OF BERM).

177 SE2d 513-518 (NC 1970).

Descriptors: *North Carolina, *Eminent domain, *Berms, *High water mark, Land tenure, Boundary disputes, Riparian land, Beaches, Beach erosion, Tidal effects, Shores, Low water mark, Shore protection, Sea walls, Compensation, Piers, Intertidal areas, Navigable waters, Landfills, Cities, Legislation, Atlantic Ocean, Judicial decisions, Legal aspects.

Plaintiff littoral landowner sought to recover compensation for defendant town's alleged taking of property for a public purpose. In order to protect against beach erosion, defendant had constructed a berm along the ocean in front of plaintiff's property. Plaintiff alleged that the construction caused the loss of the use of his property and a fishing pier constructed in front of it. Defendant admitted construction of the berm, but alleged that the berm was located on land which had been divested from plaintiff through prior erosion by the ocean. The Supreme Court of North Carolina affirmed a lower court's nonsuit of plaintiff. In North Carolina a littoral landowner's property right extends only to the high water mark, although he has a right of access to the sea. The high water mark is generally computed in relation to the average high tide. Evidence showed that prior to construction of the berm, erosive action had placed plaintiff's land below the high water mark. The purpose of the berm was to provide protection from the sea and not to reclaim land along the beach for private owners. Therefore, title to the land was in the state, thus precluding plaintiff from obtaining compensation. (Duss-Florida)

K V BEACHLAND DEVELOPMENT CO HORITY OF SECRETARY OF THE IN-OR TO RESURVEY RIPARIAN LAND).
d 699-702 (DC Cir 1927).

iptors: *Navigable rivers, *Surveys, *Adrative agencies, *Land tenure, Administraecisions, Real property, Riparian land, Mean-Boundaries (Property), Boundary disputes, aspects, Judicial decisions, Administration, l States, Federal government.

Plaintiff development company sought to enjoin defendant Secretary of the Interior from resurveying certain riparian lands. The disputed lands had been surveyed by the United States and patented to plaintiff's predecessor. An interloper settled upon the land and applied to defendant for a survey, claiming that the lands were public and asserting his claim as a settler. Defendant's agent investigated the situation, and concluded that the original survey and meander were erroneous. However, other supervisory agents concluded that the original surveys were reasonably accurate and therefore resurvey was unnecessary. Nevertheless, defendant directed a new survey. Determining that defendant had no authority to resurvey lands which had already been conveyed by the United States, the Court of Appeals of the District of Columbia held that the original survey and its meanders were reasonably accurate and enjoined resurvey, noting that but for a contemplated township in the area, the resurvey request would probably not have been made. OFFSHORE LANDS WITHIN BISCAYNE NATIONAL MONUMENT (OWNERSHIP OF LANDS OUTSIDE STATE'S THREE-MILE LIMIT),
Office of the Solicitor (Interior), Washington, D. C. Div. of Public Lands.
David E. Lindgen.
Memorandum Opinion to the Director, National Park Service, from Office of the Solicitor, Department of the Interior, Division of Public Lands, Jan 29, 1970. 3 p.

Descriptors: *Ownership of beds, *Continental Shelf, *National monuments, *Reefs, Beds, Submerged Lands Act, Legal aspects, Judicial decisions, Legislation, Federal Government, United States, Florids, Public lands, Oceans, Natural resources, International law, Exploration, Exploitation.

Responding to a request by the director of the National Park Service, this memorandum opinion from the Division of Public Lands discusses ownership of lands within the Biscayne National Monument lying outside the state of Florida's three-mile limit. The opinion makes four conclusions. First, the state of Florida, under the Submerged Lands Act, has exclusive jurisdiction over submerged lands within the Biscayne National Monument to a distance of three miles from its coastline. Second, under the Geneva Convention on the Continental Shelf, the United States has exclusive sovereign rights in the outer continental shelf, for purposes of exploration and exploitation of natural resources, seaward of the three-mile limit. However, these rights do not encompass ownership in its usual sense. Third, the location of the boundary lines between state and federal jurisdiction have not been finally adjudicated by the Supreme Court. Litigation involving location of the boundary is now before the Court. Finally, as decided in United States v Ray, 423 F.2d 16 (5th Cir 1970), two reefs within the Monument, but outside the three-mile limit, are part of the Continental Shelf and under United States jurisdiction. (Duss-Florida)

SOMEBODY FOULED UP THE SEAS,
Stephen Solomon.
New Republic, Vol 163, p 21-23, Oct 31, 1970.

Descriptors: *Oceans, *Water pollution control, *Water pollution sources, *Oil wastes, Water pollution, Pollutants, Water Quality Act, Water pollution effects, Pollution abatement, Non-structural alternatives, Oily water, Ships, Transportation, Law of the Sea, Oil industry, Oil, International waters, Treaties, International commissions, International law, Regulation, Legislation.

Two international conventions aimed at curbing oil pollution on the oceans are discussed in this article. The Convention on Civil Liability for Oil Pollution Damages sets the polluter's liability at $134 per ton up to a ceiling of $14 million for each ship involved in an oil spill. The author feels that the ceiling is too low in light of the size of the new super-tankers being built and urges that the oil industry, which reaps the profits from the huge tankers, should bear the cost of damages caused by oil spills. The convention only covers oil tankers, leaving other vessels free to pollute, and excepts ship owners from liability for acts of God, war, or acts of third parties. The author proposes delaying adoption of the Convention until the drafting is complete on a new treaty imposing virtually absolute liability with much higher limits on ship owners. The Convention on Intervention on the High Seas in Cases of Oil Pollution Casualties permits nations to act on the high seas to protect their coastlines from imminent danger. An amendment to a 1954 convention prohibits oil discharge on the high seas except for a certain amount per mile. The author argues that the prohibition should be absolute and the oil industry should be required to build on-shore dumping facilities. (Liptak-Florida)

THE 'FINAL' WATER WELL LAW AND REGULATIONS (STANDARDS FOR WATER WELL CONSTRUCTION AND PUMP INSTALLATION),
Ground Water Resources Inst.
Durward Humes.
Water Well Journal, Vol 20, p 3-11, Jan 1966. 1 tab, 9 ref.

Descriptors: *Public health, *Well regulations, *Water wells, *Legislation, Construction, Pumps, Pumping, Standards, Regulation, Well permits, Drilling, Administrative agencies, Administration, Groundwater, Water quality, Inspection, Installation, Well casings, Artesian wells, Well screens, Excavation, Water policy, Aquifers, Percolating water, Legal aspects.

Reflecting the desire of the well-manufacturing industry to protect public health and to upgrade construction standards in the industry, the Model Water Well Construction and Pump Installation Act prescribes state regulation of the well-construction industry. This report contains the proposed law, explanatory comments accompanying important sections, and proposed model administrative regulations. Also included is a table outlining standards for the construction of wells. The general scope of the Act is to prohibit construction of wells in violation of its applicable rules and regulations. The state department of health or some other appropriate agency would administer and enforce the Act, and the department would have the powers necessary to: (1) require permission and notification in designated areas before construction of water wells, abandonment of water wells, or installation of pumping equipment in any wells; (2) inspect water wells, abandoned water wells or pump installations; (3) license water well contractors; and (4) grant exemptions from the operation of the Act. Sections cover fees, procedures for enforcement, administrative hearings, judicial review and penalties for violations. The administrative regulations define more specifically standards and procedures under the Act. (Duss-Florida)

ONONDAGA WATER SERVICE CO V CROWN MILLS, INC (UTILITY NEEDS TO CONDEMN ONLY AMOUNT OF WATER USED).
132 Misc 848, 230 NYS 691-704 (Sup Ct 1928).

Descriptors: *New York, *Condemnation, *Natural flow, *Condemnation value, Water supply, Legal aspects, Judicial decisions, Remedies, Damages, Eminent domain, Mills, Public utilities, Lakes, Streams, Riparian rights, Dams, Water storage, Public rights, State governments, Legislation.

Plaintiff water supply company sought to obtain by condemnation the right to withdraw six million gallons of water daily from a lake which fed a stream on which defendant operated his mills. Defendant claimed the reduction in flow would diminish the power at the mills and argued that as riparian owner he was entitled to the undiminished natural flow. The trial court ruled that a riparian owner did have the right to an unaltered flow of water past his property, but a state statute allowed condemnation of this right. Defendant also contended that the statute's language required condemnation of all of defendant's right to the flow, not merely part of it. The court noted this would mean payment as though the flow had stopped, despite the fact some water would still flow past defendant's property and the mills could still operate. The court said the language required condemnation only of the water taken. In fact, the court noted, the plaintiff under the statute could condemn the water only for public use, and since only six million gallons were needed for public use, plaintiff could not condemn more than that. The court ordered appraisers appointed. (Morris-Florida)

UNWILLING HOST TO UNWANTED GUEST,
Nebraska Soil and Water Conservation Commission, Lincoln.
Warren D. Fairchild.
Water Spectrum, Army Corps of Engineers, p 24-29, Winter 1970.

Descriptors: *Water policy, Legal aspects, Research and development, *Flood plains, *Floods, *Planning.
Identifiers: *Flood plain management, *Flood plain information.

Nebraska has been the victim of several disastrous floods in recent years, and consequently passed legislation which has become a model of flood plain regulation. The Nebraska Flood Plain Regulation Act delineates potential flooding areas within the flood plain, enforces zoning ordinances, and reviews and upgrades the program based on changing physical and technical conditions. Launching a new approach for the protection of communities must involve a public information program, therefore, the Nebraska Commission had sessions with city councils, used television announcements, and published pamphlets to inform the public. Possibly the most significant accomplishment growing out of the Nebraska experience has been the establishment of lines of communication among various federal and state agencies whose areas of responsibility overlap. The state legislature has not funded the Commission sufficiently, but the first steps have been taken to develop the flood plain regulation program. Also, the National Flood Insurance Program, 1968, will encourage cities to follow directions of Nebraska's flood regulation act. (Wray-Chicago)

SYKES V SYKES (UPPER PROPRIETOR'S RIGHT TO ALLOW WATER TO DRAIN ONTO LOWER PROPRIETOR'S LAND).

197 NC 37, 147 SE 621-622 (1929).

Descriptors: *North Carolina, *Drainage, *Surface runoff, *Riddance (Legal aspects), Relative rights, Roads, Highways, Ditches, Legal aspects, Judicial decisions, Remedies, Surface drainage, Land, Real property, Runoff, Drainage water, Surface waters, Alteration of flow, Diversion.

Defendant filled a ditch on property adjacent to a road separating his property from plaintiff's, causing surface waters to drain onto and damage plaintiff's property. Defendant contended that the road was private and that the ditch was on his property. On court instructions to find for defendant if the road was private, the jury in the trial court found for defendant. Plaintiff excepted to the instructions. The Supreme Court of North Carolina affirmed. Where a road is private, the land on either side belongs to adjoining landowners. Upper proprietors have the right to accelerate the flow of water from their land to land of lower proprietors, so long as they do not alter its natural direction of flow. In the instant case there was no evidence that the water was diverted from its natural course. Defendant was entitled to fill a ditch on his own property to facilitate drainage of his land. NORTHERN COLORADO WATER CONSERVANCY DISTRICT: A POLITICAL SYSTEM,
Colorado State Univ., Fort Collins. Dept. of Political Science.
Stanley J. Bastian.
Master of Arts thesis, Dec 1970. 218 p, 4 fig, 8 tab, 69 ref. OWRR Project B-029-COLO (4).

Descriptors: *Systems analysis, *Administrative agencies, Decision-making, Water management, Colorado, *Water resources development, *Environment, Planning.

The Northern Colorado Water Conservancy District (NCWCD), a major water distributing agency on the East Slope of the Continental Divide in northeastern Colorado, is the focus of this study. The study treats (1) the environmental forces which generated political activity designed to provide a solution to the problem of water shortages within north-eastern Colorado, (2) the political actions which led to the formation of the NCWCD, and (3) the adaptations the NCWCD has made to imputs from its environment. The NCWCD is conceptualized and analyzed as a political system. The analysis is primarily based upon a search of the minutes of the NCWCD Board of Directors' meetings, agency reports, personal interviews, pertinent government documents, and newspaper articles relating to the structure and decision-making process of the NCWCD. This study relies heavily upon the minutes of the Board meetings for the major source of information used to analyze and characterize the NCWCD political system. The major findings indicate that formation of political systems is preceded by increasingly formal and integrated political activity designed to reduce environmental stresses that cannot be handled by existing social systems. The activities and structural characteristics of a political system are determined by the primary goals pursued and the environmental forces which threaten or facilitate their realization. Political systems pass through identifiable stages of evolutionary development. As the environment changes, the goals, activities, and structural characteristics of the systems's decision-makers are modified to permit the reduction of tension within the system and protection from external threats. PLANNING IN LOCAL WATER ORGANIZATIONS,
Colorado State Univ., Fort Collins. Dept. of Political Science.
Julian Pineda.
A Master of Arts thesis, Dec 1970. 97 p, 12 fig, 26 tab, 57 ref. OWRR Project B-051-COLO (1).

Descriptors: *Planning, Organization, Decision-making, *Water districts, Water resources development.
Identifiers: Comprehensive planning.

The study is a comparative organizational analysis of the planning process in two types of local water distribution organizations, domestic water supply and irrigation supply. The differences and the similarities in planning behavior are examined from two perspectives: (1) the type of the organization, and (2) the size of the organization. The analysis was based upon data obtained from a ten per cent sample of each of the two types of organizations in an area of high population density. Persons who were responsible for organizational planning v contacted and interviewed. The data was sec through the use of a standardized questionn designed to measure the extent to which orgar tions engaged in planning. The findings evidenc strong linkage between the type and size of the ganizations and the patterns of organizati planning behavior. It was found that these relat ships existed along three dimensions. First, ganization type was related to organizati planning behavior. Domestic water organizat devoted more attention to organizational plan activities than did the irrigation organizati Second, organization size showed a definite r tionship to planning behavior. More attention devoted to planning in the larger irrigation domestic organizations than in smaller orgar tions. Third, a definite relationship was found exist between organization type, organization and planning behavior. (Wray-Chicago)

Descriptors: *New York, *Ownership of be *Dams, *Non-navigable waters, Riparian rights, dustrial use, Damages, Remedies, Legal aspec Judicial decisions, Relative rights, Condemnati Right-of-way, Streamflow, Beds, Beds under wat

Plaintiff riparian landowner, whose predeces had condemned a strip of his property runni along a stream, sought an injunction to prevent fendant corporation from maintaining a dam acr the stream. Plaintiff contended that the condemn tion of the strip of land along the stream, when h by his predecessor, did not divest his predecessor title to the streambed. Plaintiff thus contended t defendant had no right to maintain a dam acr the stream. Defendant contended that it h acquired title to both the right-of-way and t streambed from its predecessor. The court he (1) that the condemnation of the right-of-way not deprive the riparian landowner of title to t bed; (2) plaintiff's predecessor had title to the b because grants of land bounded by a stream conv the bed to the center of the stream; and (3) plaint was entitled to have the stream flow past his ripa

an property in its natural condition. Plaintiff could have the dam removed if he could show substantial damage. (Quesada-Florida)

BAILEY V UNITED STATES (LIABILITY OF UNITED STATES FOR PRESIDENT'S ULTRA VIRES CONDEMNATION OF OYSTER BEDS).
62 Ct Cl 77-96 (1926).

Descriptors: *Oysters, *Beds under water, *Condemnation, *United States, Leases, Federal government, Eminent domain, Compensation, Payment, Beds, Ownership of beds, Low water mark, Intertidal areas, Navigation, Judicial decisions, Legal aspects, Remedies.

Plaintiff lessee of oyster beds sued defendant United States for compensation for the taking of oyster beds. Plaintiff had leased oyster beds below low water mark from the state and had planted oysters. Pursuant to congressional legislation authorizing condemnation only to the low water mark, the President condemned plaintiff's lands for use as a naval base. Bulkheads were emplaced and the lands were filled. Defendant refused to compensate plaintiff. Since defendant's lease was below low water mark, the court concluded that the taking was ultra vires. Hence the court held that plaintiff possessed no rights within the authorized taking, nor without it, since an agent could not bind the United States to pay for an unauthorized taking. Plaintiff also contended that defendant's acts were not in exercise of navigational improvements, but the court observed that a naval base intrinsically involved navigational improvements. Accordingly, plaintiff was held unable to recover. (Hart-Florida)

E OUTER CONTINENTAL SHELF--MANAG- (OR MISMANAGING) ITS RESOURCES,
rge Miron.
nal of Maritime Law and Commerce, Vol 2, 2, p 267-288, Jan 1971. 22 p, 58 ref.

Descriptors: *Continental Shelf, *Resource development, *Exploration, *Expolitation, Administrative agencies, Administration, Legislation, United States, Federal government, State governments, Environment, Environmental effects, Leases, Permits, Public rights, Mineralogy, Oil, Oil industry, Oil waste, Marine geology, Oceans, Conservation, Evaluation, Geological survey, Treaties. Identifiers: *Outer Continental Shelf Lands Act, *National Environmental Policy Act.

It is contended that the United States at present is mismanaging the resources of the Outer Continental Shelf. The Outer Continental Shelf Lands Act has extended United States jurisdiction to the Shelf for purposes of exploration and exploitation of resources and vests most of the responsibility for administering the Shelf in the Secretary of Interior. The author argues that there have been two principal failings in the administration of this Act. The first is an absence of environmental safeguards in the procedures for permitting exploration of the Outer Continental Shelf. The second is mismanagement of Shelf mineral exploitation. In the area of environmental protection the author finds that there is insufficient public participation in the permit procedure and a failure to obtain exploration data from permittees. As for mineral exploitation, the Department of Interior has followed an imprudent leasing strategy and permitted the control of output to be accomplished through state proration systems, which increases costs by setting quotas of production to wells regardless of their output potential. The author offers recommendations for improving the administration of Shelf resources. (Duss-Florida)

RECENT DEVELOPMENTS IN THE LAW OF THE SEAS: A SYNOPSIS,
Michael B. Harris, and Anthony Lovett.
San Diego Law Review, Vol 7, No 3, p 627-673, July 1970. 47 p, 68 ref.

Descriptors: *Oceans, *Legal aspects, *Water pollution, *Law of the sea, Judicial decisions, Legislation, Water resources development, International law, Admiralty, Administrative agencies, Administrative decisions, Water pollution effects, Water pollution control, Water pollution sources, Pollution abatement, United States, State governments, Oil, Wildlife, Zoning, Ships, Navigable waters, Navigation, Mineralogy, Fishing, Conservation.

This compilation of summaries of legal developments in the law of the seas between July 1, 1969, and March 15, 1970, covers the following areas: (1) conservation, both domestic and international; (2) fishing; (3) minerals; (4) navigable waters; (5) pollution, including domestic-inland, domestic-coastal, and international pollution; (6) salvage; (7) shipping; (8) sovereignty, including sections on jurisdiction and on the Northwest Passage; (9) water; (10) wildlife; and (11) zoning. The developments summarized include comments on enacted legislation, case law, meetings, conventions, executive proposals, and treaties. For example, the section discussing navigable waters includes a note on a federal district court decision regarding United States condemnation of a Maryland island and a comment on another federal district court decision regarding the contest of the Army Corps of Engineers' denial of an offshore dredge and fill permit in Florida. The section on domestic-coastal pollution comments on: (1) the Santa Barbara oil spill aftermath; (2) the ACLU suit to enjoin oil drilling in the Santa Barbara channel; (3) new leakage in the Santa Barbara channel; (4) a criminal action against oil companies involved in the Santa Barbara channel oil spill; and (5) proposed legislation banning oil drilling in the channel. (Hart-Florida)

A LEGAL REGIME FOR DEEP SEA MINING,
Ocean Resources Inc., La Jolla, Calif.
John L. Mero.
San Diego Law Review, Vol 7, No 3, p 488-503, July 1970. 16 p, 26 ref.

Descriptors: *International law, *Mineralogy, *Oceans, *Law of the sea, United Nations, Foreign countries, Governments, United States, Mineral industry, Continental Shelf, Oceanography, International waters, Water pollution control, Exploration, Exploitation, Legal aspects, Water pollution.

Since the magnitude of the mineral resources of the sea is enormous, deep sea mining is a crucial factor in world development. However, only a few nations possess the technological capability to exploit deep sea minerals. Anomalously, these minerals have been termed the 'common heritage of mankind.' To ensure that this 'common heritage' inures to all people this article proposes a legal regime to control development of deep sea mining. The author notes that a legal regime is necessary to control pollution. Before outlining the proposed regime, the author describes the nature of deep sea deposits and their potential to world society. First, he discusses the jurisdiction of riparian nations in the oceans, established by the Geneva Convention. The spectrum of minerals available in seafloor nodules is examined in detail. A timetable for deep sea mining is proposed. A leasing agency, operated by the United Nations and having largely administrative functions, is suggested as the beginning of a legal regime to control deep sea mining. After establishment of the agency, the author proposes a code of laws allowing technically and financially competent nations to claim limited portions of the ocean floor. The laws would prevent interference with other ocean uses. (Hart-Florida)

WILLIS V BOYD (VALIDITY OF MINING LEASE IN RIVER BED).

224 KY 732, 7 SW2d 216-218 (1928).

Descriptors: *Kentucky, *Navigable rivers, *River beds, *Leases, Ohio River, Banks, Islands, Ownership of beds, Legislation, Local governments, State governments, Legal aspects, Judicial decisions, Excavation, Sands, Gravels, Mining, Steamboats, Boundaries (Property).

Plaintiff brought action to enjoin defendant from removing sand and gravel from the bed of the Ohio River. Plaintiff contended that he had an exclusive 50-year lease to remove sand and gravel from the river bed. Defendant contended that the statute authorizing the lease was invalid as in conflict with statutes limiting the acreage that the state and counties could patent to private parties. Moreover, defendant contended that the statute conflicted with the consitutional prohibition against legislation. The court noted that the limit on saleable acreage did not apply to leases of mining rights, that the statute could not affect any private property, and that the act was of general application although only affecting the Ohio River. However, the court reversed a lower court judgment for plaintiff, holding that the rights granted by the lease were profits a prendre and could only be granted at public auction and only for 20 years. THE SETTLEMENT OF DISPUTES BETWEEN FEDERAL AND STATE GOVERNMENTS CONCERNING OFFSHORE PETROLEUM RESOURCES: ACCOMMODATION OR ADJUDICATION,
John L. Taylor.
Harvard International Law Journal, Vol II, p 358-399, 1970. 42 p, 205 ref.

Descriptors: *Beds, *Ownership of beds, *Continental Shelf, *Boundary disputes, Boundaries (Property), International waters, Interstate compacts, Oil, Federal government, State governments, Inland waterways, Judicial decisions, Legal aspects, Submerged Lands Act, Coasts, Gulf of Mexico, Great Lakes, Political aspects.

The increasing demand for petroleum has initiated an ongoing dispute between state and federal governments with regard to the ownership of offshore lands and the petroleum deposits therein. The author of this article assumes an international perspective in making a comparative examination of the ownership dispute in the United States, Canada, and Australia. A brief analysis is made of the problems and contrasting modes of dispute-settlement in each jurisdiction. The procedures examined are those of accommodation and adjudication. A constitutional and historical background is given in an effort to elucidate the practicality and efficacy of dispute-settlement procedures. The author concludes with a jurisprudential discussion of dispute settlement and his suggestions for reaching a satisfactory result. The author recommends settlement of such disputes by the political arm of government. In the opinion of the author, judicial settlement should be resorted to only when political solutions fail. NATIONAL ENVIRONMENTAL POLICY ACT OF 1969.

42 USCA secs 4321 thru 4335, 4341 thru 4347 (Supp 1970).

Descriptors: *Environment, *Administrative agencies, *Environmental effects, *Federal project policy, Legislation, Federal government, Ecology, Environmental gradient, Environmental sanitation, Administration, Adoption of practices, Decision making, Operations research, Project planning, Legal aspects, Leadership, Administrative decisions, Coordination, International waters.
Identifiers: *National Environmental Policy Act.

This National Environmental Policy Act of 1969 establishes a Council on Environmental Quality and declares that the federal government will use all practicable measures to improve the national environment. Federal agencies are directed to cooperate with each other and with the Council on Environmental Quality. Every recommendation or report made by an agency must include: (1) the environmental impact of the proposed action, (2) unavoidable adverse environmental effects, (3) alternatives to the proposal, (4) the relationship between short-term use and long-term productivity, and (5) irretrievable resource committments should the proposal be implemented. Agencies are required to recognize international environmental problems and support programs to prevent deterioration of the world environment. The President shall transmit an annual report on the state of the environment to congress and shall provide a program for remedy of environmental deficiencies. The Council on Environmental Quality is composed of three qualified members appointed by the President. It must: (1) assist the President in preparing his report to Congress, (2) monitor the national environment, (3) appraise federal programs in light of the environment, (4) conduct environmental research, (5) document environmental changes, (6) report to President annually on the environmental condition, and (7) make such other reports as the President requests. ESTABLISHMENT OF THE OHIO RIVER BASIN COMMISSION.

Exec Order No 11578, Federal Register, Vol 36, No 11, p 683-684, Jan 16, 1971. 2 p.

Descriptors: *Water Resources Planning Act, *River basin development, *River basins, *Administrative agencies, River basin commissions, Land resources, Drainage, Ohio, State governments, Tennessee River, Federal government, Administration, Interstate compacts, Interstate commissions, Planning, Water resources development, Interstate.
Identifiers: *Executive orders.

Pursuant to the Water Resources Planning Act (79 Stat. 244, 42 U.S.C. 1962 et. seq.), which provides for the establishment of river basins, water and related land resources commissions, the President of the United States, Richard Nixon, established the Ohio River Basin Commission. This Commission shall have jurisdiction in those portions of the states of Kentucky, Illinois, Indiana, Maryland, New York, North Carolina, Ohio, Pennsylvania, Tennessee, Virginia, and West Virginia that are located within the Ohio River drainage basin, excluding the Tennessee River drainage basin. The Commission shall consist of: (1) a chairman, appointed by the President; (2) one member from each of several federal departments and agencies; (3) one member from each of several selected states within the affected areas; and (4) one member from each interstate agency created by an interstate compact whose jurisdiction extends to the waters of the area specified. The duties of these members shall be executed in accordance with the provisions of the Water Resources Planning Act. (Barnett-Florida)

DELAWARE RIVER BASIN COMMISSION CHARGES FOR WATER SUPPLY.
Delaware River Basin Commission, Trenton, N.J.

Federal Register, Vol 36, No 9, p 566-567 (Jan 14, 1971). 2 p.

Descriptors: *Administrative agencies, *Delaware River Basin Commission, *Water supply, *Water rates, Water users, Water demand, Water distribution (Applied), Federal government, Water costs, Water management (Applied), Water storage, Water quality, Contracts, Legal aspects, Administration, Costs, Operation and maintenance, Cities, Non-consumptive use, Pumping, Pumping plants, Administrative decisions, Diversion.

Notice is published herein that the Delaware River Basin Commission will hold a public hearing on Thursday, January 28, 1971, for discussion of a proposed resolution of policy to develop a rate basis for settling charges to users of water supplied by the Commission. Since: (1) revenues from the sale of water have been authorized as a means of repaying the non-federal share of the federal investment cost of water supply storage facilities, and (2) the Commission requires further policy to develop a fair and defensible rate basis for setting charges to users, the Commission has resolved to implement a five step plan for the imposition of water use charges. The proposed plan is reproduced in full. Those wishing to testify as to the plan are requested to register in advance. Also, public notice is established regarding the availability of a draft report (in accordance with the National Environmental Policy Act of 1969) discussing the environmental impact of a proposed pumping plant on the Delaware River at Point Pleasant, Pennsylvania. (Barnett-Florida)

Water Pollution Control Act.

The Federal Water Pollution Control Act requir
every vessel over 300 gross tons to maintai
evidence of financial responsibility to meet any li
bility to the United States resulting from th
discharge of oil into United States waters. Th
River and Harbor Act of 1970 amended th
Federal Water Pollution Control Act to exclud
from the financial responsibility requirements
the Act 'any barge that is not self-propelled an
that does not carry oil as cargo or fuel.' Pursuant t
that amendment, the Federal Maritime Commi
sion proposes to amend its regulation concernin
maintaining and providing evidence of financi
responsibility. New definitions are added, definin
'cargo' as including both proprietary and no
proprietary cargo, and 'fuel' as any oil capable
being burned for heat or power. (Liptak-Florida)

Identifiers: *Water Pollution Control Act, *Administrative regulations.

To insure consistency and uniformity in the implementation of section 704 of the Tax Reform Act, he functions of other agencies concerning certifiation of water pollution control facilities and air ollution control facilities were transferred to the dministrator of the Environmental Protection gency. The Administrator proposed combined egulations regarding certification of air and water ollution control facilities for tax deduction purposes. All applications will be filed with the state ertifying agency, which will forward the applicaon and the state certification to the Administra. The Administrator will not certify a facility ior to completion but may give notice of intent to ertify provided the completed facility conforms to e applicable air or water quality standards. Applitions shall contain specified data including a escription of the proposed facility and its funcn, cost, and expected useful life. Federal policy to cooperate with the states to enhance the quali and value of air and water resources. To be ceried, a facility must: (1) control pollutants which ould otherwise be released into the environment,) not be part of the manufacturing process, (3) eet all state and federal air or water quality stanrds, and (4) not recover its own cost through ofits from recovered waste products or otherse. YORK COVE CORP V UNITED STATES (LIABILITY FOR DREDGING OPERATIONS INCIDENT TO IMPROVEMENT OF NAVIGATION).

317 F Supp 799-813 (Ed Va 1970).

Descriptors: *Federal government, *Navigable waters, *Dredging, *Navigation, Damages, Federal jurisdiction, Land tenure, Oysters, Leases, Commercial shellfish, Relative rights, Piers, Regulation, Beds, Real property, State jurisdiction, Navigable rivers, United States, Beds under water, Ownership of beds, Water pollution, Legal aspects, Judicial decisions, Remedies.

Plaintiff oyster-ground lessees sought compensation from defendant United States and its dredging contractor for damages to oyster beds. Plaintiff contended that defendant contractor, in repairing a naval pier, had negligently deposited spoil in a navigable channel near plaintiff's beds. Plaintiff held his lease under a state grant in an area previously ceded to the United States. Defendants asserted that dredging operations were incident to improvements in navigation and denied negligence. As to defendant United States, the United States district court held that: (1) the federal government may assert the doctrine of dominant navigational servitude as a defense to allegedly negligent dredging incident to the construction of a naval pier; (2) governmental supervision of allegedly negligent dredging does not invoke liability under the Federal Tort Claims Act, (3) a state is without jurisdiction to lease rights in underwater lands ceded to the United States, and (4) only the Secretary of the Navy is empowered to relinquish federal interests in submerged lands under naval jurisdiction. Determining that the United States had validly asserted the defense of navigational servitude, the court ruled that plaintiff had failed to prove defendant contractor's negligence, since the evidence was just as convincing that a severe storm had caused plaintiff's injury. WILD AND SCENIC RIVERS ACT.
16 USCA secs 1271 thru 1287 (Supp 1969).

Descriptors: *Legislation, *Wild rivers, *Administration, *Conservation, Rivers, River systems, Recreation, Scenery, Water policy, Administrative agencies, Administrative decisions, Federal government, Federal project policy, Hydroelectric project licensing, Permits, State governments, Water pollution, Water pollution control, Eminent domain, Condemnation, Compensation.

In the Wild and Scenic Rivers Act, Congress declares that certain rivers shall be protected and preserved in their original condition. Rivers are categorized as: (1) wild, accessible only by trial; (2) scenic, accessible by trail generally, and by road over portions; and (3) recreationa, readily accessible by road or railroad. Eight rivers are named as components of the national wild and scenic rivers system, to be administered by either the Secretary of Agriculture or Interior. Either Secretary may propose additions to the system by making a report to the President and Congress. Reports must be coordinated with other affected agencies and published in the Federal Register. Twenty-seven other rivers are designated as potential additions to the system; the Secretaries of Interior and Agriculture are directed to study each to determine the advisability of including it in the system. Limited power of condemnation is provided both secretaries to acquire land along the rivers. The Federal Power Commission is directed not to authorize construction of any power facility on a river which is a component of the system or any facility directly affecting a component river. Further, the Federal Power Commission is admonished not to authorize any project for five years on a river which is a potential component unless it is concluded that the river will not be included in the system. Cooperation with local government is solicited. (Hart-Florida)
W71-04819

MONSANTO CO V EDWARDS TOWING CORP (DAMAGES TO DOCK FACILITY CAUSED BY BREAKAWAY OF MOORED BARGES).
318 F Supp 13-17 (ED Mo 1969).

Descriptors: *Docks, *Damages, *Ships, *Admiralty, Wharves, Rivers, Mississippi River, Missouri, Water levels, Judicial decisions, Legal aspects, Adjudication procedure, Navigable waters, Water level fluctuations, Fluctuation.

Plaintiff company brought suit against defendant towing company for damages to its dock facility. Four barges broke loose from a load fleet operated by defendant and struck plaintiff's dock. Defendant denied any negligence and filed a third-party complaint against another towing company which had tied two of the barges, alleging that the third party failed to adequately secure defendant's barges. The second towing company denied any negligence and filed a third-party complaint against a company whose vessel had passed the barges immediately prior to the breakaway, alleging that the vessel passed at an unreasonable speed and in close proximity to defendant's barges, causing the breakaway. The federal district court found against the original defendant. The burden is upon a drifting vessel to show her freedom from negligence. Defendant, as a bailee, had the duty of caring for barges in its custody. A breakaway establishes a prima facie case of negligence against the operator of the moving vessel. Defendant was informed of a coming rise in the river which would require a change in mooring yet did nothing. No evidence indicated that the second towing company improperly moored the two barges or that the passing vessel generated a swell which would have caused the breakaway. (Duss-Florida)

WATERFOWL AND MIGRATORY BIRDS (REGULATION AND LICENSING OF WATERFOWL HUNTING).
Maryland Code Ann art 66 C, secs 150 thru 155, 157, 159, 161 thru 162 A, 164 thru 165 (Supp 1970).

Descriptors: *Maryland, *Legislation, *Hunting, *Waterfowl, Game birds, Migratory birds, Recreation, Small game, Wildlife, Wildlife conservation, Wildlife management, Regulation, Permits, Riparian land, Riparian water, State governments, Boats, Tidal waters, Fishing, Legal aspects.

The hunting of any wild water fowl shall be illegal in Maryland and except on dates set by federal regulation or the State Department of Game and Inland Fish. Hunting is prohibited on Sundays and hunting of protected waterfowl is illegal. Waterfowl may be hunted only with shotguns under ten gauge and long bows and arrows; all other weapons are prohibited. Sneak boats and body booting rigs may be licensed, and riparian owners have special licensing rights. Hunting by boat is forbidden. Shoreline distance requirements and application dates must be followed by riparian owners seeking to license blind sites. It shall be unlawful to set out grain to lure game birds; violators may be fined or imprisoned. Named counties are exempt from blind site distance requirements. The clerks of the circuit courts are to issue licenses and to collect the fees established herein upon proper application and certification for the specified dates. Blind sites shall be subject to inspections and licenses may be revoked for violations of the Act. Certain distances must be maintained between blind sites by property owners seeking to license sites in front of their property. Trespassing on another's blind and fishing within 500 yards of a blind are prohibited and licenses are required for operation of hired hunting boats. Penalties are provided for violators where specific penalties are not otherwise specified. (Liptak-Florida)
W71-04822

UNITED STATES V 8,968.06 ACRES OF LAND (VALUATION OF RIPARIAN LAND IN EMINENT DOMAIN PROCEEDINGS).
318 F Supp 698-704 (SD Tex 1970).

Descriptors: *Federal government, *Riparian land, *Eminent domain, *Condemnation value, Navigable rivers, Value, Property values, Appreciation, Depreciation, Land appraisal, Evaluation, Reservoirs, Riparian rights, Federal jurisdiction, Riparian waters, Condemantion, Real property, Land tenure, Legal aspects, Judicial decisions, Relative rights, Remedies.
Identifiers: *Constitutionality.

In eminent domain proceedings condemning land for a reservoir project intended to improve navigation, plaintiff United States sought to exclude evidence of land value arising from access to or utilization of navigable waters. Defendant riparian owner of agricultural land sought to establish the land's potential value as a channel-cut subdivision wherein all lots would have frontage on man-made channels. Defendant contended that depreciative consequences of the riparian location, such as the possibility of flooding, should be excluded in valuing the land. The United States district court held that under the doctrine of dominant navigational servitude a riparian owner of condemned land may not show potential land value arising from non-passive utilization of and access to navigable streams. However, value which is attritutable to mere passive proximity to navigable waters is compensable. Evidence of the depreciative consequences of the riparian location is admissible. The test for determining what potential land use may be shown is whether such use may be prohibited or destroyed by the United States without creating a consitutional duty to compensate. The court held riparian owners are not entitled to receive compensation or restrain injury incurred incident to navigational improvements. Plaintiff's motion was granted. (Earl-Florida)

COASTAL WATERS AND THE NATION,
National Council on Marine Resources and Engineering Development, Washington, D.C.
Edward Wenk, Jr.
Civil Engineering, Vol 39, No 6, p 52-55, June 1969.

Descriptors: *Water pollution control, *Federal government, *Coasts, *Resources.
Identifiers: *Planning for multiple use.

Most of the nations population and industry are on the coasts. Recreation, maritime trade, fish and crustacean industry, offshore oil and gas industry are all coastal activities. The coastal area as a resource is diminishing rapidly due to marshland filling, waste disposal, oil seepage and tanker accidents. Planning which rationally weighs the demands for development against esthetic and natural resources is needed. The federal government is undertaking studies and considering state managed Coastal Zone Authorities for planning and regulating land and water use. The states have legal jurisdiction over most coastal resources but need better coordinated and stronger agencies. (Ensign-PAI)

AN ACT RELATING TO WATER POLLUTION CONTROL.

Laws of Vermont, No 252, Public Acts, 1969 Adjourned Session, p 252-264 (1970). 13 p.

Descriptors: *Vermont, *Legislation, *Administrative agencies, *Water pollution control, Water pollution, Water pollution sources, Water pollution effects, Water resources, Pollutants, Pollution abatement, Permits, State governments, Legal aspects.

This legislation categorizes all Vermont waters into two classes. Class A waters are: (1) waters of lakes, ponds, or reservoirs used for public water supply and (2) water flowing into these waters. Class B waters are all other waters. The following factors are used to classify degree of water quality to be required of water classes: (1) existing water quality; (2) existing or potential water uses; (3) natural sources of pollution; (4) public and private pollution sources; (5) need for mixing zones; (6) existing and potential use of waters for public water supply, recreational, agricultural and other uses; (7) suitability of waters as habitats for fish and wildlife; (8) need for minimum stream flow; (9) federal requirements for classification and management; (10) municipal, regional, and state plan; and (11) any other relevant factors. The act prohibits discharge of any material into state waters without a permit. Temporary permits may be issued. A permit allowing the discharge of material into waters of the state will be denied where the discharge would reduce the quality of the water below the level established for its classification. (Hart-Florida)

ENVIRONMENTAL QUALITY IMPROVEMENT.
42 USCA secs 4371 thru 4374 (Supp 1970).

Descriptors: *Legislation, *Environment, *Federal government, *Administrative agencies, Ecology, Conservation, Contracts, Legal aspects, Water policy, Administration, United States, Natural resources, Natural resources development.

The Environmental Quality Improvement Act of 1970 was enacted to implement the national policy of enhancing the environment. The legislation has two purposes: (1) to assure implementation of the national environmental policy by federal agencies; and (2) to authorize an Office of Environmental Quality. The Chairman of the Council on Environmental Quality is designated director of the Office. A deputy director is appointed by the President. The duties of the director are: (1) to provide the staff and support for the Council on Environmental Qualtiy; (2) to assist federal agencies in appraising the effectiveness of federal projects affecting environmental policy; (3) to review the adequacy of existing systems for monitoring and predicting environmental changes; (4) to promote advancement of scientific knowledge of the environment; (5) to assist in coordinating environmental activities of federal agencies; (6) to assist federal agencies to develop environmental quality standards; and (7) to collect and analyze information on environmental quality. The director is authorized to contract with public or private agencies in performing his duties. Environmental quality reports are to be referred to a standing congressional committee. Appropriations for the office through 1973 are established. (Hart-Florida)

WATERS AND WATER SUPPLY--POLLUTI -PENALTY.
New Jersey Session Law Service, Chapter (1970), amending, NJ Revised Stat secs 58: 58:10-2, 58:10-4.

Descriptors: *New Jersey, *Water pollu *Remedies, *Legislation, Administrative agen Pollution abatement, Pollutants, Water pollu control, State governments, Non-structural alte tives, Legal aspects, Cities.

This amended statute provides that whoever lutes state waters shall be fined $1000 for the day and $3000 for each day thereafter. Each continuance is a separate offense. The local b of health in the jurisdiction where the offense curs is empowered to sue for payment of pena imposed by this section. The Department of He is authorized to settle with the offender. The recovered are to be paid either into the State T sury or into a municipal treasury, depending u the identity of the plaintiff in the action. In a tion, the statute provides that a summary injunc may be issued to restrain pollution. Either the partment of Health or a local health board seek the injunction. (Hart-Florida)
W71-04838

AN ACT TO CREATE AN ENVIRONMENT BOARD AND DISTRICT ENVIRONMENT COMMISSIONS.
Laws of Vermont, No 250, Public Acts, 1969 journed Session, p 237-250 (1970). 14 p.

Descriptors: *Vermont, *Legislation, *Adminis tive agencies, *Environment, Land managem Land development, Land classification, Land Land resources, Water resources, Nat resources, Scenery, Aesthetics, State governme Legal aspects, Administration, Permits, Admi trative decisions.

This legislation creates a state environmental bo and nine district environmental commissions. board and district commissions are to consider plications for permits to develop and subdiv land. Before granting permits, the commissi must consider whether subdivisions: (1) will re in undue air or water pollution; (2) have suffici water available; (3) will unreasonably burden ex ing water supplies; (4) will cause unreasonable erosion or reduce the capacity of the land to h water; (5) will cause highway congestion (6) unreasonably burden local educational facilit (7) will unreasonably burden local governme sources; or (8) will have an unduly adverse ef upon the scenic and natural beauty of the are

which proposed. A development must also conform to a development plan and a land use plan promulgated by the board. The purpose of the development plan is to achieve a coordinated, efficient, and economic development of the state. The land use plan is based upon the development plan and consists of a map and statements of present and prospective land uses. These plans must be approved by the governor. (Hart-Florida)

CALIFORNIA DEPT OF FISH AND GAME V S S BOURNEMOUTH (SHIP'S LIABILITY FOR DAMAGES RESULTING FROM OIL SPILL).
318 F Supp 839-842 (CD Cal 1970).

Descriptors: *California, *Oil wastes, *Ships, *Water pollution sources, Water pollution, Admiralty, Harbors, Navigable waters, Damages, Winds, Wind tides, Tides, Chemical analysis, Legal aspects, Judicial decisions, Oil industry.

Plaintiff state of California sought damages from defendant vessel for damages resulting from an oil spill in a harbor. Defendant denied that it was the source of the spill and contended that, even if it were the source of the pollution, there was no evidence of any intentional or negligent acts or omissions of the defendant's crew which might have caused the spill. The federal district court rendered judgment for the plaintiff. Evidence of the location of the spill in relation to the location of the ship and chemical analysis of oil from the spill supported a finding that defendant was the source of the oil spill. Secondly, the facts of the case presented an appropriate situation for application of res ipsa loquitur. Oil spills of this type would not ordinarily occur without negligence, and the evidence eliminated any other cause which might have been responsible for the spill. (Duss-Florida)

ENVIRONMENTAL SERVICE (CREATION OF STATE AGENCY FOR WASTE TREATMENT CONTROL).
Maryland Code Ann art 33B, secs 1 thru 32 (Supp 1970).

Descriptors: *Maryland, *Legislation, *Waste disposal, *Administrative agencies, Sewage disposal, Waste water disposal, Waste treatment, Solid wastes, Waste water (Pollution), Environmental sanitation, Sewage treatment, Waste water treatment, Water districts, Water purification, Public health, Water pollution treatment, Water quality control, Cities, Governments, State governments, Government finance, Government supports, Planning, Legal aspects.

To provide for more effective purification and disposal of liquid and solid wastes, the Maryland Environmental Service is created and provisions made for personnel and expenses. The Environmental Service shall be responsible for planning, research, development, and construction of waste water purification and solid waste disposal projects in cooperation with the affected municipalities. The Service may: (1) contract, (2) sue and be sued, (3) acquire property, (4) exercise eminent domain powers, and (5) borrow money and issue bonds to carry out its functions. The Service's prime responsibility is to create waste water purification and waste disposal regions and districts and, after public hearing, to adopt five-year plans for the projects needed in each region. Upon the failure of a person or a municipality to carry out an order of the Secretary of Health or the Secretary of Natural Resources, the Service may carry out those orders and charge the non-complying party for its expense in so doing. The Service is authorized to issue revenue bonds and fix rates and fees to provide a fund retirement fund. The Public Service Commission will arbitrate any rate disputes and judicial review shall be available, including the right of appeal to the Maryland Court of Appeals. (Liptak-Florida)
W71-04841

WETLANDS (REGULATION OF DREDGE AND FILL OPERATIONS ON STATE AND PRIVATE WETLANDS).
Md Code Ann, Art 66c, Secs 718 thru 731 (Supp 1970).

Descriptors: *Maryland, *Wetlands, *Dredging, *Landfills, Conversation, State governments, Tidal waters, Excavation, Land forming, Land development, Water conservation, Permits, Natural resources, Riparian rights, Riparian land, Water resources, Coasts, Environmental effects, Regulation, Administrative agencies, Administrative decisions, Legal aspects, Adjudication procedure, Legislation.

Whereas dredging, dumping, and filling are despoiling Maryland's wetlands and diminishing their value as wildlife habitats and recreation centers, it shall be public policy to protect and preserve the state's wetlands. Riparian owners shall be guaranteed the right to natural accretion and to make improvements, consistent with this policy, to preserve access to the water. All dredging and filling on the state's wetlands is unlawful unless licensed by the Board of Public Works. When considering a license application, the Board shall take into account the ecological, economic, developmental, recreational, and aesthetic factors of each project. Anyone violating the Act may be fined and shall pay the State for the restoration of the wetlands affected. The Secretary of Natural Resources shall make an inventory and a map of all private wetlands within the state and adopt rules and regulations governing dredging and filling of private wetlands. Affected landowners are entitled to a hearing and to a review of the inventory or the rules and regulations. Persons wishing to conduct activities not authorized by the rules and regulations may apply for a permit under defined application, notice, and hearing procedures. The Secretary shall consider the impact of the proposed work under the stated public policy. Parties are entitled to a jury trial de novo, not subject to the state administrative procedure act. Violators may be fined or imprisoned. Riparian rights are unaffected except as specifically provided. (Liptak-Florida)
W71-04842

PUBLIC WATER SUPPLY AND SEWER SYSTEM (FINANCIAL SUPPORT FOR MUNICIPAL SEWAGE TREATMENT WORKS).
Tennessee Code Ann secs 53-2017 thru 53-2028 (Supp 1970).

Descriptors: *Tennessee, *Legislation, *Sewage treatment, *Government supports, Treatment facilities, Public utilities, Sewage, Pumping plants, Sewage disposal, Municipal wastes, Industrial wastes, Domestic wastes, Sewers, Water Quality Act, Water pollution treatment, Governments, Local governments, State governments, Government finance, Water law, Taxes, Financing, Cost repayment, Water works, Water rates, Cities.

After defining sewage treatment works, construction, department, eligible project, municipality, and federal pollution abatement assistance, this chapter of the Tennessee Code authorizes the State of Tennessee to grant funds to assist municipalities in the construction of sewage treatment works. The public health department is designated to administer the grants and may contract with municipalities subject to specified financial provisions. A sewage treatment works construction fund is created in the state treasury and may be maintained by appropriations and bond sales. Municipalities receiving aid shall establish and collect a sewer users fee according to the listed schedule of residential and commercial-industrial users service charges. Cities may make sewer use mandatory, shall have enforcement powers, and may bring actions to collect delinquent charges. Municipalities may levy and collect additional fees or tolls for maintenance and operation or debt payments. Users fees shall be remitted to the state funding board for retirement of bond issues and any excess shall be returned to the municipalities. Deficiencies shall be paid out of increased user rates or ad valorem taxes, and the state may withhold funds from any muncipality failing to remit fees. (Liptak-Florida)
W71-04843

AALSBURG V CASHION (RELATIVE RIGHTS TO ACCRETED LAND ON NAVIGABLE LAKE SHORE).
180 NW2d 792-798 (Mich 1970).

Descriptors: *Michigan, *Accretion (Legal aspects), *Boundary disputes, *Real property, Relative rights, Lakes, Lake shores, Land tenure, Navigable waters, Riparian land, Bank erosion, Boundaries (Property), Riparian rights, Judicial decisions, Legal aspects.

Plaintiff riparian owners sought determination of riparian boundaries involving accreted land as against defendant adjoining riparian owners. The common grantor, after conveying all lots in question without riparian rights, executed a riparian deed creating riparian rights in all conveyed lots. Such deed also provided that a strip of shoreline along the navigable inland lake was subject to the use of all lot owners. Plaintiff asserted that defendant acquiesced, used, and consented to extension of their side lot lines in setting common boundaries over accreted lands. The Supreme Court of Michigan held that: (1) neither acquiescence nor hostile possession is made out by joint use of riparian property, nor by mutual reliance on terms of common riparian deed; and (2) a county survey will be given greater weight than a witness' testimony in determining the intent of the grantor of a common riparian deed. That part of the decision of the lower court finding neither acquiescence nor hostile possession was affirmed, and the case remanded for determination of the remaining issues. (Earl-Florida)
W71-04844

HOGUE V STRICKER LAND AND TIMBER CO (ALTERATION OF STATE BOUNDARY BY CHANGE IN CHANNEL OF MISSISSIPPI RIVER).
69 F2d 167-169 (5th Cir 1934).

Descriptors: *Louisiana, *Mississippi, *Mississippi River, *Boundary disputes, Boundaries (Property), Land tenure, Real property, Riparian land, Islands, Accretions (Legal aspects), Avulsion, Bank erosion, Erosion, Channels, State jurisdiction, Channel erosion, Channel flow, Rivers, Navigable rivers, Thalweg, Adjudication procedure, Legal aspects, Judicial decisions.

Plaintiff riparian landowner brought action against defendant land company to quiet title to accreted land. The question on appeal was the identity of the state in which the land was situated. The disputed land had accreted to an island in the Mississippi River. The river channel was originally east of the island, and hence the island was originally in Louisiana rather than Mississippi. That channel dried up and a new channel formed west of the island. Plaintiff claimed the land which had accreted between the two channels as accretions to his uplands on the Mississippi side. The Fifth Circuit Court of Appeals determined that when a stream's course between states changes by erosion and accretion, the boundary moves with the channel, but where the course changes by avulsion, suddenly leaving the old channel, the boundary is unaltered. Where, as in the instant case, the drying up of a channel results from the diversion of water into a new channel, rather than from accretion, the change must be likened to avulsion. In such a case state boundaries are unchanged. The court held that the disputed land was in Louisiana and that the Mississippi court was without jurisdiction. (Hart-Florida)

PRESERVATION OF FISHERY RESOURCES (AUTHORIZATION OF FEDERAL-STATE AGREEMENTS AND COST SHARING).
16 USCA secs 757 A (a), 757 A (c), 757 D (a) (Supp 1970) amending 16 USCA secs 757 A, 757 D (1964).

Descriptors: *Federal government, *State governments, *Anadromous fish, *Fish conservation, Legislation, Fisheries, Fish management, Fish populations, Environmental effects, Federal project policy, Cost allocation, Cost sharing, Project planning, Project purposes, Administrative agencies, Administrative decisions, Administration, Water resources development, Non-structural alternatives, Legal aspects, Conservation, Coordination, Contracts, Benefits, Fish.

The Secretary of the Interior is authorized by this legislation to enter into cooperative agreements with states or other non-federal interests to conserve, develop and enhance anadromous fishery resources which are being depleted by water resources developments. Any such agreement must prescribe: (1) actions to be taken by the parties; (2) expected benefits; (3) estimated costs; (4) the share of the costs to be borne by the respective parties; (5) duration; (6) means of disposing of property acquired during the agreement; and (7) other conditions the Secretary desires. The federal share of costs shall not be more than 50%, and the non-federal share may be in form of realty or personalty. When two states enter into the agreement with the Secretary, the federal share is increased to 60%. Appropriations through fiscal 1974 are established. (Hart-Florida)

ANDERSON V CITY OF LUDLOW (CITY'S LIABILITY FOR STORM-SEWER OVERFLOW FOLLOWING STREET IMPROVEMENTS).
250 Ky 204, 62 SW2d 785-788 (Ky 1933).

Descriptors: *Kentucky, *Storm drains, *Paving, *Flood damage, Cities, Drainage systems, Sewers, Floodwater, Soil surfaces, Overflow, Surface runoff, Damages, Surface drainage, Flow rates, Real property, Land tenure, Local governments, Legal aspects, Judicial decisions, Flow, Road construction, Excess water (Soils), Rainfall-runoff relationships.

Plaintiff residential lot owner sought to recover damages from defendant city for flooding resulting from storm sewer overflow. Plaintiff's property was flooded after defendant city paved and constructed catchbasins for nearby streets. The sewer line in question was constructed prior to the incorporation of plaintiff's property into defendant's municipal boundaries. Plaintiff contended that defendant's improvements created the overflow by diverting additional water into the formerly adequate sewer system. Defendant denied that its actions diverted surface water into the sewer lines at issue. The Court of Appeals of Kentucky held that a municipal corporation is not liable for flooding damages where street improvements merely accelerate but do not increase the volume of water flowing into a sewer line in existence prior to incorporation of territory into a city. The court denied plaintiff relief, ruling that defendant's street improvements had only accelerated the flow of water which previously was partially absorbed by trees and soil. (Earl-Florida)

TECHNOLOGICAL INJURY,
Blackburn Coll. of Technology and Design (England).
J. Rose.
New York, Gordon and Breach, 1969. 224 p.

Descriptors: *Technology, *Pollution, *Environment, Air pollution, Water pollution, Pesticides, Computers, Transportation, Social aspects, Government, Radioactive wastes.
Identifiers: *Technological change, Noise, Level, Drugs.

This book is a collection of fifteen papers concerned with the effect of technology on environment, life and society. It attempts to present an account of the potential and actual dangers of technological advances by outlining the main areas of conflict and danger. It is of interest to the water researcher not only due to its explicit consideration of water pollution but also because of the insights it provides into water resources problems through the treatment of related environmental areas. The first section is concerned with pollution of the environment and considers the problems of air and water pollution, radioactivity, pesticides, drugs and pollution of outer space. The second section considers the effects on society and life of drugs, genetics, computers, transportation, noise, and leisure and concludes with a general discussion of the effect of technological change. MAN AND AQUATIC COMMUNITIES.

Spring 1970 seminar. Oregon State University, Corvallis, Water Resources Research Institute SEMN WR 012.70, 1970. 106 p, 11 fig, 2 tab, 71 ref. OWRR Project A-999-ORE (6).

Descriptors: *Ecology, *Aquatic environment, *Eutrophication, *Lakes, *Oregon, Industries, Marine animals, Fresh water, Radiation, Aquiculture, Fish, Ponds, Ecosystems, Monitoring, Management, Adhesives, Dye releases, Oysters, Bioassay, Salinity, Bacteria, Algae, Insects, Copepods, Detritus, Rhodophyta, Chlorophyta, Cyanophyta, Protozoa, Mollusks, Fungi, Ferns, Gymnosperms, Radioisotopes, Mussles, Snails.
Identifiers: *Rocky shores, *Cultural impact, *Lake evolution, Chironomids, Ostracods, Desmids.

Applied and more fundamental studies relating to metabolism and physiological requirements of algae and other aquatics, and to development of assay procedures for detecting increased enrichment and its effects are discussed. Rocky shores are described with plans for educational field trips. The Weyerhaeuser Company, supporting operations and products other than lumber, has research teams studying aquatic problems. Oyster investigations, experimental stream studies, liquid waste monitoring, and waste treatment facility performance are described. A historical review

EFFECT OF COOLING TOWER EFFLUENT ON ATMOSPHERIC CONDITIONS I NORTHEASTERN ILLINOIS, PRELIMINAR REPORT,
Illinois State Water Survey, Urbana.
F. A. Huff, R. C. Beebe, D. M. A. Jones, G. M. Morgan, Jr., and R. G. Semonin.
Available from State of Illinois, Dept. of Registr tion and Education. Illinois State Water Surve Circular 100, 1971. 37 p, 1 fig, 2 tab, 57 ref.

Descriptors: *Cooling water, *Cooling tower *Water cooling, *Nuclear powerplants, *Wat pollution sources, *Air environment, *Meteor water, Thermal pollution, Fog, Cloud physics, A pollution, Air-water interfaces, Microenvironmen Micro-climatology, Weather modification, Rai fall, Snowfall, Computer models, Industrial water.
Identifiers: *Cooling tower effluents.

Controversy presently exists over the use of Lak Michigan and other natural water bodies for th discharge of waste heat from large electric powe plants. This problem has become especially acut in the case of a 2200-megawatt nuclear power plan of the Commonwealth Edison Company now nea ing completion at Zion, located on Lake Michiga in the northeastern part of Illinois. This plant wa designed for once-through-cooling utilizing lak discharge of the waste heat, but this method o cooling has met opposition. An alternative metho of solving the thermal pollution problem is throug the use of large cooling towers. However, this alter native then raises concern about the environmenta consequences of the effluent discharge into the at mosphere from the towers. Numerical modelin provided quantitative estimates of how high plume cloud ejected from the 250-foot Zion tower would rise. It was found that the top of the mois plume could vary between 1800 and 5500 feet Other results indicated that the enhancement o warm season rainfall by Zion tower plumes woul probably be negligible but an average annual in crease of 1 to 2 inches of snowfall could be ex pected within a distance of 2 miles inland from the power plant. Analyses indicated that the typical onshore lake breeze in spring and early summer would not normally trap the tower plume cloud near the ground to enhance inland fogging. The lake breeze interaction with the tower effluent is not expected to increase significantly convective cloudiness and rainfall in the Zion area. (Poertner)

ESTIMATING SUSPENDED SEDIMENT CONCENTRATIONS IN STREAMS BY TURBIDITY MEASUREMENTS,
Agricultural Research Service, Danville, Vt.; and Agricultural Research Service, Beltsville, Md. Hydrograph Lab.
Samuel H. Kunkle, and George H. Comer.
Journal of Soil and Water Conservation, Vol 26, No 1, p 18-20, January-February 1971. 3 p, 3 fig, 10 ref.

Descriptors: *Suspended load, *Turbidity, Stream erosion, Scour, Sediment transport, Vermont, Sampling, Estimating, Erosion, Discharge (Water), Topography, Soil properties, Snowmelt.
Identifiers: *Sleepers River Experimental Watershed (Vt).

Turbidity and suspended sediment analyses were made on stream samples collected in the Sleepers River watershed of northeastern Vermont. Results showed that turbidimeter readings could be used to estimate suspended sediment concentrations in the 16- to 6,366-milligrams-per-liter range. The prediction equation was similar for the three watersheds studied, where soils, topography, and other factors were essentially the same. Samples were collected during two years of storm and snowmelt runoff on catchments draining from 16.2 to 43.5 square kilometers. Discharges reanged from 140 to 18,000 liters per second. The sediment particles were mostly of stream bank origin and were primarily silt or very fine sand. (Knapp-USGS)

S. Ben-Yaakov, and I. R. Kaplan.
Journal of Geophysical Research, Vol 76, No 3, p 722-731, January 20, 1971. 10 p, 4 fig, 4 tab, 21 ref. USAEC Contract AT (04-3)-34 PA 178.

Descriptors: *Calcium carbonate, *Aqueous solutions, *Sea water, *Water chemistry, *On-site tests, Sampling, Chemical precipitation, Saturation, Equilibrium, Instrumentation, Pacific Ocean, Chemical potential, Oxidation-reduction potential, Hydrogen ion concentration.
Identifiers: *Saturometers.

An in situ oceanographic system was used to measure the degree of saturation of calcium carbonate in sea water. Results of two profiles measured in the eastern Pacific Ocean off southern California are described and compared with data obtained by conventional chemical techniques. From this preliminary study it appears that the waters investigated become undersaturated with calcite at a depth of approximately 400 meters and remain so to a depth of about 1600 meters, where they tend toward saturation. Below 2500 meters they appear to become undersaturated again and probably remain so to the depth of the ocean floor. (Knapp-USGS)

DIGITAL COMPUTER SIMULATION OF WASTE TREATMENT PLANTS USING THE WATCRAP-PACER SYSTEM,
Waterloo Univ. (Ontario). Dept. of Chemical Engineering.
P. L. Silveston.
Water Pollution Control, Volume 69, No 6, p 686-693, 1970. 8 p, 5 fig, 4 tab, 6 ref, 1 append.

Descriptors: Digital computers, *Simulation analysis, *Waste water treatment, *Computer programs.
Identifiers: Computer subroutines, Ontario.

The initial phase of an investigation of the adec
cy of process models available in sanitary
chemical engineering and a demonstration
suitable sets of process models are capable
reproducing the performance of operating wa
treatment plants were discussed. The WATCR
PACER, a digital computer program which si
lated the behavior of plants treating dome
and/or industrial waste waters was developed
use by engineers with minimal knowledge of c
puters and programming. First the general
gram, PACER, was described as having an exe
tive program and a library of subroutines wh
model unit processes and operations such as
ing, chemical reactions, and distillation. A rec
system determined by the executive program
PACER was shown. For simulation of streams
waste treatment plant network, 'information' c
tent for each stream was used by and stored in
PACER executive as a stream variables list or v
tor. A short vector consisting of the standard t
used to characterize wastes and a long vector c
sisting of BOD, total and volatile suspended sol
as well as temperature and alkalinity was used
the WATCRAP program. The WATCR
PACER system was applied to a conventional
tivated-sludge treatment plant at Kitchener an
trickling filter plant at Oshawa in Ontario. (Kr

A study was conducted to: (1) review and amend
1964 Black and Veatch Master Plan of Waterwor
Improvements as supplemented by a 1967 Unive
sity Study; (2) correlate new potential develo
ment areas located beyond the present water se
vice area with the Madison utility facilities; (
evaluate water use and development trends durin
the past five years; and (4) modify previous
recommended improvements resulting fro
changed conditions. The recommendations mad
to the City of Madison are: (1) continue plannin
to serve a population of 240,000 by 1980; (2) giv
consideration to computerizing the tabulation
water sales to provide water-use records; (3) pr
vide for a 1980 maximum daily demand rate of 7
mgd; (4) install 167,000 feet of water mains durin

1969-1974 and 198,300 feet during 1975-1980; (5) replace the two Dayton Street Reservoirs; (6) modify existing unit well station booster pumping facilities to change discharge gradients and capacities; (7) construct three new unit well supplies before 1974 and one between 1975 and 1980; and (8) construct five new ground storage reservoirs with a total capacity of 9 mg. In addition, miscellaneous improvements to booster stations, unit wells and water mains are recommended. The cost estimate for the initial (1969-1974) construction is $5,202,800. Additional requirements during the 1975-1980 period are estimated at $4,626,000. (Poertner)

THE FINITE DAM II,
Western Australia Univ., Nedlands.
P. B. M. Roes.
Journal of Applied Probability, Vol 7, No 3, p 599-616, December 1970. 18 p, 3 fig, 11 ref.

Descriptors: *Water allocation (Policy), *Weirs, *Water balance, Inflow, Overflow, Laplaces equation, Markov processes, Time.
Identifiers: *Finite dam.

A weir of capacity K was considered in which the water inflow was a process with stationary independent increments. When the weir was empty, there was a continuous release of water at unit rate; if K was infinite the weir became full in which case the excess water overflowed instantaneously. A weir for which K was infinite was referred to as an infinite dam. Its transient behavior was well known if the input possessed a second moment. A complete description of the process which used the Laplace transform (L.T.) of the Laplace Stieltjes transform (L.S.T.) was presented. The dam processes considered were Markov processes. L.S.T.'s of first entrance and taboo first entrance times and first skip times and taboo first skip times were determined. From the (taboo) first entrance and skip times, first entrance times for the finite dam were derived, which led to the renewal functions of the renewal processes imbedded in the finite dam content process v* (t) and hence to the transient behavior of the finite dam. The advantage of this approach was that it seemed entirely probabilistic and avoided involved analytic arguments. (Kriss-Cornell)

MEASUREMENT OF VARIABLE FLOW PATTERNS BY A METHOD INVOLVING DILUTION OF RADIOACTIVE TRACERS (FRENCH),
Commissariat a l'Energie Atomique, Grenoble (France). Centre d'Etudes Nucleaires.
J. Guizerix, R. Margrita, J. Molinari, B. Gaillard, and P. Calmels.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/27, p 463-477, 1970. 15 p, 10 fig, 2 ref.

Descriptors: *Discharge measurement, *Tracers, *Tracking techniques, *Mixing, Streamflow, Hydraulic models, Model studies, Flowmeters, Path of pollutants, Unsteady flow, Non-uniform flow, Diffusion, Dispersion.
Identifiers: *Mixing (Tracers).

Measuring variable water flow patterns is an important problem for the calibration of limnimetric stations and certain hydroelectric installations, and also for determining the pollution of industrial effluents. Although the flow pattern is linear with respect to the tracer, the water and tracer, taken together, form a non-linear system. The conditions for linearizing the problem were studied in an experimental channel. As the tracer is injected at a constant rate, continuous measurements of its concentration are made in a section downstream. An analysis of the problem and the method of calculating flow are presented. Very good agreement is shown to obtain between the flow thus calculated and the flow measured by a turbine at the entrance to the channel. (Knapp-USGS)
W71-04383

THE CONCEPT OF 'GOOD MIXING' IN THE USE OF TRACERS: DISCHARGE VELOCITY AND VELOCITY OF THE CENTER OF GRAVITY OF A TRACER CLOUD IN FLOW STUDIES (FRENCH),
Toulouse Univ. (France). Institut de Mecanique des Fluides; and Commissariat a l'Energie Atomique, Saclay (France). Centre d'Etudes Nucleaires.
M. Alquier, J. Gruat, G. Courtois, and G. Sauzay.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/26, p 441-461, 1970. 21 p, 4 fig, 2 ref.

Descriptors: *Tracers, *Tracking techniques, *Mixing, Diffusion, Streamflow, Measurement, Statistical methods, Probability, Dispersion, Dye releases, Radioisotopes, Tagging, Discharge (Water), Discharge measurement.
Identifiers: *Mixing (Tracers), *Streamflow tracing.

In measuring flows by means of tracers it is common to use integration methods which use the concept 'condition of good mixing'. This relation is general, regardless of the method used, and may be deduced from general definitions of perfect tracers and of the extent to which the flow is represented by the tracer. It appears to be a necessary and sufficient condition for measuring flow by tracers, independent of the initial injection conditions. A relation can therefore be established between the flow and one or more characteristic parameters of the movement of the tracer. For example, in the methods using the velocity of the center of gravity of a cloud of tracer, there is a relation between this velocity and the mean velocity of the fluid. The value of the ratio between these two velocities is a function of the profile of the velocities of the flow studied. This calculation makes use of the theory of probability and principles of fluid mechanics. A number of methods use the idea of the mean time of transit between two given sections. Formulas used in these calculations are listed. (Knapp-USGS)
W71-04384

APPLICATION OF PROBABILITY TO SPILLWAY DESIGN FLOOD ESTIMATION,
State Rivers and Water Supply Commission, Melbourne (Australia).
G. N. Alexander.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 536-543, 1969. 8 p, 3 fig, 19 ref.

Descriptors: *Probability, *Design flood, *Probable maximum precipitation, *Flood forecasting, *Peak discharge, Discharge (Water), Rainfall-runoff relationships, Reservoir design, Flood control, Statistical methods, Risks, Depth-area-duration analysis.
Identifiers: Spillway design flood, Australia.

There are two schools of thought concerning the estimation of floods which should be adopted for the design of spillways for large dams. The first is the method of Probable Maximum Precipitation (PMP). This method uses the maximization and transposition of storms and avoids any reference to risk. The second uses procedures of mathematical statistics to determine the required capacity for a selected level of probability. There are serious limitations at present in both approaches: in the first, the limitation is inherent, for PMP cannot be quantitatively defined and hence estimates are primarily matters of judgment; in the second, the procedures have not been sufficiently developed to be acceptable to the engineering profession generally. The discussion of the problems includes: (a) the purely mathematical problem of estimating the probability of occurrence of an event in a given period such as the 'life' of a dam given the return period of the event; (b) the socio-economic problem of estimating the risk to be stipulated for spillway design floods, as influenced by the number and life of dams; (c) some mathematical probability procedures using distributions in time and space for estimating rare events; in particular the observed data can be 'extended', provided that the initial data are statistically homogeneous. COMPUTATION OF DESIGN SPRING FLOOD HYDROGRAPH,
All-Union Designing, Surveying and Scientific Research Inst. Hydroproject, Moscow (USSR).
G. A. Leskov.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 722-727, 1969. 6 p, 3 fig, 1 tab.

Descriptors: *Design flood, *Snowmelt, Hydrographs, Flood forecasting, Reservoir design, Flood control, Probability, Frequency analysis, Peak discharge.
Identifiers: USSR.

When designing hydraulic structures on rivers and reservoirs and determining spillway capacity and dimensions for controlling high floods, it is necessary to evaluate not only the design discharge of the river at the proposed dam site but also to have a hydrograph of the entire flood wave for a given design probability. The procedure developed in the 'Hydroproject', USSR, allows, under condition of availability of a long series of river runoff observations, calculation and plotting of a flood hydrograph corresponding to the given probability of instantaneous discharge and that of maximum runoff for periods of one day and longer. The proposed procedure may be applied to rivers on which the yearly flood peak can easily be determined. (Knapp-USGS)

MATHEMATICAL MODEL FOR WATER DISTRIBUTION SYSTEMS,
Arya Mehr Industrial Univ., Tehran (Iran).
Mehdi S. Zarghamee.
Journal of the Hydraulics Division, ASCE, Vol 97, No HY1, p 1-14, January 1971. 15 p, 8 fig, 1 tab, 5 ref, 2 append.

Descriptors: *Mathematical models, *Computer program, *Water distribution (Applied), Steady flow, Simulation analysis, Network design, Hydraulics.
Identifiers: *Hardy Cross method, *Newton iteration method, Nonlinear equations, Iran, Chizar reservoir, Niavaran reservoir.

A mathematical model was developed for predicting the steady-state flow pattern for a water distribution system consisting of conduits, pumps,

pressure reducing valves, and reservoirs. The model was a computerized numerical simulation of the network. Each component was assumed to be governed by a specific, characteristic flow formula which in most cases was nonlinear. The equilibrium of flow in the network was governed by a system of nonlinear equations which were solved by the Newton iteration method. A great deal of numerical effort was saved by combining several conduits that were formulated to form an equivalent conduit. The mathematical model developed was coded in a computer program and was verified against the Hardy Cross method which involved joint relaxation in contrast to the proposed method where the entire network was relaxed simultaneously. Comparison revealed that the rate of convergence of the proposed method was greater than that of the Hardy Cross method. The existing water distribution system which supplies water to the Chizar area, Tehran, Iran, consisting of the Chizar reservoir and the Niavaran reservoir, served as an example for analysis of the method described. 8C. Hydraulic Machinery

OPTIMIZATION OF AN ELECTRODIALYSIS PLANT,
McDonnell Douglas Astronautics Co., Newport Beach, Calif. Water Technology Dept.
George Belfort, and John A. Daly.
Desalination, Vol 8, No 2, p 153-166, October 1970. 14 p, 7 fig, 3 tab, 8 ref.

Descriptors: *Optimization, *Simulation analysis, *Mathematical models, *Digital computer, *Electrodialysis, Costs, Operations, Streams, South Dakota, Desalination.
Identifiers: Webster (S Dak).

Using models of both the cost procedures and the physical plant design, an optimization routine was constructed for an electrodialysis plant. An introduction to previous optimization studies, including a frequently used linear model was presented first. A detailed description of the combined simulation model, used as the kernel of the optimization routine, was divided into two parts: a model of the electrical properties of the electrodialysis stacks and a model of the costs associated with a given plant design. The two models were combined and programmed for a digital computer. In order to discover the optimum configuration, the independent or decision variables used were: (1) the stack design to be used; (2) the number of parallel streams in the plant; (3) the number of stages or stacks per stream; and (4) the reduction of salt concentration that was to be accomplished in each stage. A flow chart for the program was given and the optimization process where two or more stack designs were compared for particular application was summarized. The algorithm was applied to plant requirements at Webster, South Dakota and compared actual cost and operating conditions with optimal and nonoptimal conditions. Other uses of the model were also considered. (Kriss-Cornell)

DETERMINING SEEPAGE CHARACTERISTICS OF MILL-TAILINGS DAMS BY THE FINITE-ELEMENT METHOD,
Bureau of Mines, Spokane, Wash. Mining Research Lab.
C. Daniel Kealy, and Richard A. Busch.
Report of Investigations 7477, January 1971. 113 p, 2 tab, 34 fig, 52 ref, 4 append.

Descriptors: Mine wastes, Waste disposal, *Mine drainage, Mine water, Groundwater movement, Waste dumps, Hydraulic models, *Seepage, Environmental engineering, Environmental sanitation, Slope stability, Soil physical properties, Mathematical models, *Earth dams, Phreatic lines.
Identifiers: *Tailings dams.

Finite-element, mathematical models that solve LaPlace's or Richard's equation numerically were used to locate the phreatic surface within tailings pond embankments and to define the subsurface flow of water from the pond. Both must be known to design structurally and environmentally safe tailings dams. The permeability distribution within and beneath the embankment, and the geometry and elevation of an approximately impermeable layer at some depth beneath the embankment were used as inputs in analyzing over a dozen finite-element models of tailings dams varying from simple to complex. Results predicted with the finite-element model were confirmed with measurements in a laboratory model of a tailings pond and in the field. Of particular importance to the design of safe slopes, all data indicated that the phreatic surface within a tailings dam is concave upward, a configuration opposite that in most earth dams. The close correlation between predicted and experimental values confirmed the practicability of using the finite-element technique to design safe tailings dams.

8H. Rapid Excavation

THE USE IN HYDROLOGY OF ISOTOPES PRODUCED BY PEACEFUL UNDERGROUND NUCLEAR EXPLOSIONS (RUSSIAN),
Hydrometeorological Service of the USSR, Moscow. Inst. of Applied Geophysics.
Yu. A. Izrael', and F. Ya. Rovinskiy.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/59, p 815-820, 1970. 6 p, 1 fig, 1 tab.

Descriptors: *Nuclear engineering, *Nuclear explosions, *Hydrogeology, *Tracers, *Path of pollutants, Radioisotopes, Radioactive wastes, Tritium, Groundwater movement, Excavation, Underground.
Identifiers: *USSR, *Nuclear explosions (Underground).

Various isotopes produced during the construction of hydraulic engineering works by means of underground nuclear explosions are discussed with reference to their use as tracers for the investigation of the hydrological regime in the construction area. An assessment is given of the relative yields of the isotopes, their capacity to pass into aqueous solutions and their migration potential, taking into account their distribution over the various zones and carrier particles and the effects of fractionation. It is concluded that the best tracer for solving hydrological and hydrogeological problems is tritium. Study of the migration of other isotopes is important from the point of view of possible radioactive contamination of water. Experimental data are given on the migration of radioactive isotopes during construction of a model reservoir in the Soviet Union and on the role of these isotopes in the study of the hydrological regime of the reservoir. CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the EPA-Water Quality Office, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.

Supported by the Environmental Protection Agency in cooperation with WRSIC.

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Agricultural livestock wastes at the Department of Agricultural Engineering of Iowa State University.
- Methods for chemical and biological identification of pollutants at the Battelle Memorial Institute.
- Coastal pollution at the Oceanic Research Institute.

Subject Fields

- NATURE OF WATER
- WATER CYCLE
- WATER SUPPLY AUGMENTATION AND CONSERVATION
- WATER QUANTITY MANAGEMENT AND CONTROL
- WATER QUALITY MANAGEMENT AND PROTECTION
- WATER RESOURCES PLANNING
- RESOURCES DATA
- ENGINEERING WORKS
- MANPOWER, GRANTS, AND FACILITIES
- SCIENTIFIC AND TECHNICAL INFORMATION

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 4, NUMBER 10
MAY 15, 1971

THE LIBRARY OF THE
DEC 3 1971
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

W71-04851 -- W71-05334

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 4, NUMBER 10
MAY 15, 1971

W71-04851 -- W71-05334

se of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency, Water Quality Office. A directory of the Centers appears on inside back cover.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

THE EFFECT OF SELECTED HYDROLOGIC VARIABLES ON STREAM SALINITY,
Agricultural Research Service, Chickasha, Okla. Soil and Water Conservation Research Div.
H. B. Pionke, and A. D. Nicks.
International Association of Scientific Hydrology Bulletin, Vol 15, No 4, p 13-21, December 1970. 9 p, 5 fig, 4 tab, 7 ref.

Descriptors: *Water quality, *Rainfall-runoff relationships, *Streamflow, *Salinity, Precipitation (Atmospheric), Antecedent precipitation, Regression analysis, Rain gages, Oklahoma.
Identifiers: Stream salinity forecasting.

A relationship of hydrologic variables with stream salinity was determined statistically for two ephemeral streams located in western Oklahoma. The hydrologic variables employed in this study are measures of streamflow, precipitation, antecedent conditions, and agricultural land use. The best single estimate of stream salinity was achieved by use of those variables classed as direct measures of precipitation, with the greatest variability in stream salinity (51%) being predicted by the maximum amount of precipitation received at any rain gage one in the watershed during one month. Antecedent conditions did not correlate well with stream salinity, except for the variable describing the antecedent stream salinity. Similarly, the areal location of precipitation within the watershed and agricultural land use did not correlate significantly with stream salinity, except for a variable designating the distance between the stream gaging station and the rain gage zone receiving the most precipitation for the month. The best overall estimate of salinity was given by a multiple regression equation chosen on the basis of a factor analysis. This equation accounted for 65% of the variability in salinity and emphasized the contribution of variables classed as direct measures of precipitation. In comparing the two streams, the watershed having the most intensive rain gage network produced the best prediction equation. (Knapp-USGS)

WATER RESOURCES OF EUROPE,
Akademiya Nauk SSSR, Moscow. Institut Geografii.
I. M. Chernogaeva.
International Association of Scientific Hydrology Bulletin, Vol 15, No 4, p 67-76, December 1970. 10 p, 5 fig, 1 tab, 31 ref.

Descriptors: *Water balance, *Runoff, *Hydrologic budget, Hydrology, Water resources, Hydrologic cycle, Climates, Climatology, Mapping, Reviews.
Identifiers: *Water balance (Europe), *Europe.

This paper outlines the results of the research of the water balance of Europe which is a part of the research work on the water balance of the USSR and the continents carried on by the USSR Institute of Geography. The research has been done on the basis of the complex differentiated water balance equations which make it possible to determine major water sources including a soil water component. In Europe the surface runoff varies greatly, from 10 mm in the arid steppes of the European part of the USSR up to 1500 mm and over in the Alpine and neve-glacial belts of mountain areas. An increase in the surface runoff is appreciable on elevations and in mountains, especially on the western slopes of longitudinally elongated mountain ridges as compared with the eastern ones. As a whole, relative values of the European water balance are near to the corresponding values for the whole Earth. (Knapp-USGS)

HYDROLOGIC AND PHOTOGEOLOGIC DETERMINATION OF RAINFALL, RUNOFF, AND GROUNDWATER RELATIONSHIPS IN A DOLOMITE AREA,
Missouri Water Resources Research Center, Rolla; and Missouri Water Resources Research Inst., Rolla.
Vernon A. C. Gevecker, and James C. Maxwell.
Available from NTIS as PB-197 734, $3.00 in paper copy, $0.95 in microfiche. Completion Report, Jan 15, 1971. 14 p, 2 tab, 4 fig. OWRR Project A-013-MO (1).

Descriptors: *Runoff, *Recharge, *Groundwater, Water wells, Rainfall-runoff relationships, Missouri, *Photogrammetry, Dolomite.
Identifiers: *Ozark watershed.

The goal was to determine the procedures needed to evaluate availability and disposition of surface and subsurface waters in an 18 square mile Ozark watershed underlain by partially cavernous dolomite. Hydrologic objectives were compilation and analysis of rainfall and streamflow records to estimate losses of surface water and recharge to groundwater. Photogeologic objectives were to identify, map and measure soils, vegetation, land use, sinkholes, linears, and drainage patterns. Stream recording was interrupted by bed load which blocked recorder inlets, by highway crews who altered channels, and by flood loss of a recorder house. Flows at high stages were unobtainable because of their infrequency, unpredictability and short duration. Rainfall was measured by volunteers. Soil types were identified on airphotos and mapped. Land use and vegetation were also photo-mapped. Water wells, located by field interviewing and measured when possible, were mapped. Stream losses in the upper creek were not calculable but in the lower reaches were 18 cubic feet per second. Runoff of 5.1 to 5.4 inches per square mile was 12 to 14 percent of the annual rainfall of 37 to 41 inches. (Maxwell-Missouri)

SYNTHESIZING HYDROGRAPHS FOR SMALL SEMIARID DRAINAGE BASINS,
Geological Survey, Cheyenne, Wyo.
G. S. Craig, Jr.
For sale by Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $3.75. Geological Survey Research 1970, Chapter D, Professional Paper 700-D, p D238-D243, 1970. 6 p, 6 fig, 1 tab, 1 ref.

Descriptors: *Hydrograph analysis, *Peak discharge, *Ephemeral streams, Hydrographs, Frequency analysis, Wyoming, Rainfall-runoff relationships, Arid lands, Runoff forecasting, Streamflow forecasting.
Identifiers: Hydrograph synthesis.

Studies of hydrograph shape for 14 small (less than 11 sq mi) drainage basins led to the development of a possible standard dimensionless hydrograph for semiarid regions. The dimensionless hydrograph, described in detail, was developed with data from small, ephemeral streams in Wyoming. Hydrographs are synthesized from the dimensionless hydrograph by using peak discharge-volume relationships. Only the single-peak event is considered. Synthetic hydrographs produced from the Wyoming dimensionless hydrograph show close agreement with observed hydrographs from Wyoming, New Mexico, and Arizona. The procedure can be used to define a hydrograph for any selected design value of peak frequency. (Knapp-USGS)

MASS, MOMENTUM, AND ENERGY BUDGET EQUATIONS FOR BOMAP COMPUTATIONS,
National Oceanic and Atmospheric Administration, Rockville, Md., The BOMAP Office.
Eugene M. Rasmusson.
National Oceanic and Atmospheric Administration Technical Memorandum ERL BOMAP-3, January 1971. 32 p, 1 fig, 4 ref, 4 append.

Descriptors: *Model studies, *Atmosphere, *Water vapor, *Hydrologic budget, *Mathematical models, Oceans, Mass, Momentum transfer, Energy, Pressure, Equations, Latent heat, Radiation, Hydrologic data, Data collections, Ships, Aircraft, Air masses, Meteorology, Climatology, Synoptic analysis.
Identifiers: BOMEX project.

Basic atmospheric budget equations were modified for use in computing the budgets of mass, momentum, and energy for the atmospheric part of the BOMEX volume, as related to the Barbados Oceanographic and Meteorological Experiment (BOMEX), May-July, 1969. Observations made during the Experiment were to estimate the total transfer of water vapor, sensible heat, and momentum from sea to air over a 500- by 500-km square. This was done by measuring the quantities entering into the continuity or conservation equation for each property, with sufficient time and space resolution to allow the integrals over the 500-km square, through approximately the lower 6 km of the atmosphere, and over a time period of 1 day. These integrated conservation equations are called the 'budget equations.' (Woodard-USGS)

FACTORS AFFECTING VARIATIONS OF MEAN ANNUAL RAINFALL IN ISRAEL,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
M. H. Diskin.
International Association of Scientific Hydrology Bulletin, Vol 15, No 4, p 41-49, December 1970. 9 p, 1 fig, 5 tab, 4 ref.

Descriptors: *Rainfall disposition, *Distribution patterns, Regression analysis, Rain gages, Variability, Arid lands, Precipitation (Atmospheric), Synoptic analysis, Isohyets, Weather data, Data collections.
Identifiers: *Israel.

A stepwise multiple linear regression analysis was used to study factors that affect the mean annual rainfall in Israel. The factors investigated were latitude, elevation, and easterly distance from the sea. Separate equations, relating the 30-year mean rainfall to these factors were derived for the northern and southern parts of the country. The regression equations reduced most of the variance of the rainfall data for the 211 rain-gaging stations included in the study. The three factors found to affect the mean annual precipitation in the northern half of the country were the latitude of the rain-gaging station, its elevation, and its longitude or easterly distance from the shore line. In the southern half of the country only the latitude and longitude appear to affect significantly the magnitude of the mean annual precipitation. Mean annual rainfall increased with the latitude of the station and with its elevation and decreased with the longitude of the station or its easterly distance from the sea. The orographic effect on mean annual precipitation in the northern half of Israel is of the order of 30 mm increase in precipitation for each 100 meters increase in elevation. The effect of longitude or easterly distance from the sea is of the order of 290 mm per degree of longitude or about 3.1 mm/km for the northern part of the country and 140 mm per degree or 1.5 mm/km in the southern part. A change of latitude of one degree causes a change of precipitation of about 210 mm (1.9 mm/km) in the norther part of the country and about 120 mm (1.1 mm/km) in the south. If the change in latitude is not made along the meridian, but along a line parallel to the shoreline, the change in the mean annual precipitation in the northern part is about 100 mm (0.9 mm/km). THE EXPERIMENTAL MODIFICATION OF LAKE-EFFECT WEATHER,
Cornell Aeronautical Lab., Inc. Buffalo, N.Y.
William J. Eadie.
Available from NTIS as COM-71-00009, $3.00 in paper copy, $0.95 in microfiche. Final report, CAL Report No VC-2898-P-1, Aug 1970. 88 p, 8 fig, 6 tab, 16 ref. ESSA Contract No E 22-6-69 (N).
Identifiers: *Weather modification, *Great Lakes, *Snow fall, Reduction, Cloud seeding, Snowstorms, Intensity, Silver iodide, Ice, Meteorological radar, Radar echo areas, Dry ice, Mathematical models, Lake Erie, *Lake effect snowstorms.

During November and December of 1968, field experiments were carried out on the southeastern shore of Lake Erie to determine the feasibility of modifying lake-effect weather. The primary objective of the experiments was to test the hypothesis that the snowfall from intense lake-effect storms could be redistributed over a larger area by overseeding with ice nuclei, thereby reducing the heavy natural snowfall near the lee shore. The experiments demonstrated that overseeding can be accomplished for short periods in lake-effect snow bands of moderate intensity.

Eugene M. Rasmusson.
Monthly Weather Review, Vol 99, No 2, p 119-135, February 1971. 17 p, 19 fig, 14 tab, 30 ref.

Descriptors: *Synoptic analysis, *Water balance, Evapotranspiration, Rainfall, Runoff, Water storage, Droughts, Precipitation (Atmospheric), Climatology, Hydrology, Weather, Atmosphere, Climatic data, Meteorology.
Identifiers: Flux divergence, Atmosphere.

The atmospheric water vapor flux divergence and the water balance of Eastern North America were investigated, using data from the period May 1, 1958, to April 30, 1963. Mean monthly values of evapotranspiration and storage change were computed as residuals, using measured values of vapor flux divergence, precipitation, and streamflow. Computed values of evapotranspiration and storage change were compared with the climatological estimates of Thornthwaite Associates and Budyko. The Thornthwaite climatic water balance data appear to overestimate the difference between precipitation and evapotranspiration, during winter and underestimate it during summ
dyko's values of evapotranspiration generall
a slightly smaller seasonal variation and ap
lead the values obtained from the atmos
budget computations by around 0.5 to 1 m
divergence computations were made for the
Mexico and Caribbean Sea. Interannual var
in storage over the Eastern Region of North
ica were found to be comparable with the se
changes. The onset of the drought of the ea
mid-1960s is clearly reflected in the cor
storage values. Variations in mean m
precipitation during winter are positively
lated with the strength of the northward f
moisture across the Gulf Coast, but little or n
tionship between these quantities appears t
during summer. (Knapp-USGS)

Toshinari Ambe.
Japanese Journal of Geology and Geography, Vol 18, No 1, p 63-77, 1967. 12 fig, 1 tab, 9 ref.

Descriptors: *Arid lands, *Climatic zones, *Geographical regions, *Water balance, *Climatic data, Maps, Statistical analysis, Temperature, Climatology, Precipitation (Atmospheric), Evaporation, Temperature, Deserts, Foreign countries, United States, Mexico, Distribution patterns, Classification, Variability.
Identifiers: *Climatic transitional regions, *Climatic classification, *Climatic types, *Potential evapotranspiration, Global studies, Continents, Hemispheres, Transitional region, South America, Asia, Africa, Australia.

It is argued that most climatic classification systems differ from the practice of defining climatic boundaries on the basis of long term yearly averages, and that unstable regions are therefore ignored. A 'transitional region' is an area where the climatic type alternates yearly in accordance with boundary variations. Since the climate of a transitional region is inherently unstable, water need planning for such a region must differ from that for humid or arid regions. Using data from the previous study on arid climate variability, the ranges of transitional regions of arid climates were determined for each continent (except parts of Asia where data are lacking). This was done by using an index of variability of arid climates depending upon the number of arid years and humid years between 1931-1960. Maps are presented for each continent. A global climatic map was then constructed with 3 climatic types--real arid regions, transitional regions and regions without an arid year. Excepting North Africa, real arid regions are not a large proportion of the area where arid years occur, and lie generally in the 25-35 deg. latitudinal zone. The transitional region occurs very widely, and in many cases should be considered as an independent region rather than as a mere boundary area. This is an important aspect of a geographical factor, and offers many problems concerning land use or agriculture. (Casey - Arizona)

C. Snow, Ice, and Frost

ENERGY EXCHANGE AND LATE SEASON SNOWMELT IN A SMALL OPENING IN COLORADO SUBALPINE FOREST,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
David R. Dewalle, and James R. Meiman.
Water Resources Research, Vol 7, No 1, p 184-188, February 1971. 5 p, 1 fig, 3 tab, 7 ref.

Descriptors: *Snowmelt, *Colorado, *Solar radiation, Melting, Radiation, Snowpacks, Energy budget, Runoff forecasting, Forests, Albedo, Data collections.
Identifiers: Radiation (Net).

Two-day melt of a late lying snow patch in a small opening in Colorado subalpine forest was largely due to net radiation and sensible heat exchange. Net radiation supplied 54% and 62% of melt energy on June 19 and 20, 1968, respectively, whereas sensible heat exchange accounted for 49% of melt energy. Three percent of melt energy was lost by evaporation each day. (Knapp-USGS)

SOME RESULTS FROM A TIME-DEPENDENT THERMODYNAMIC MODEL OF SEA ICE,
Washington Univ., Seattle. Dept. of Atmospheric Sciences and; Washington Univ., Seattle. Geophysics Program.
Gary A. Maykut, and Norbert Untersteiner.
Journal of Geophysical Research, Vol 76, No 6, p 1550-1576, February 20, 1971. 26 p, 12 fig, 8 tab, 55 ref. ONR Contract N00014-67-A-0103-0007.

Descriptors: *Sea ice, *Energy budget, *Mathematical models, *Numerical analysis, Solar radiation, Currents (Water), Snow cover, Heat transfer, Melting, Freezing, Water temperature, Ablation, Salinity, Albedo, Thermodynamics, Diffusion.
Identifiers: Sea ice model.

A one-dimensional thermodynamic model of sea ice includes the effects of snow cover, ice salinity, and internal heating due to solar radiation. Surface-energy balances determine rates of ablation and accretion; diffusion equations govern heat transport within the ice and snow. The incoming radiative and turbulent fluxes, oceanic heat, flux, ice salinity, snow accumulation, and surface albedo are specified as functions of time. The model was applied to the central Arctic. Values predicted by the model for the average ice thickness (288 cm) amount of surface ablation (40 cm), and the temperature field all agree closely with field observations. Other results from the model indicate that, under present conditions, the ocean supplies 1 to 2 kcal/sq cm year to the ice; an additional 4 kcal/sq cm year would cause the ice to vanish. Annual snow depths less than 70 cm would result in much thicker ice. About 2.0 to 2.5 kcal/sq cm year of the incoming short-wave radiation penetrates the ice and contributes to internal heating. Average ice albedos under 0.50 would cause the ice to vanish in a few years. (Knapp-USGS)
W71-05054

DESCRIPTION AND EVOLUTION OF SNOW AND ICE FEATURES AND SNOW SURFACE FORMS ON THE KASKAWULSH GLACIER,
Vermont Univ., Burlington. Dept. of Geology.
W. Philip Wagner.
In: Icefield Ranges Research Project Scientific Results, Volume 1: American Geographical Society (New York) and Arctic Institute of North America (Montreal), p 51-53, 1969. 3 p, 1 fig, 5 ref.

Descriptors: *Glaciers, *Regimen, *Diagenesis, *Snowmelt, *Ablation, Snowpacks, Seasonal, Geomorphology, Water balance, Ice, Snow, Movement, Climates, Weather, Stratigraphy.
Identifiers: Icefield Ranges (Canada), Snowfields.

Investigations of numerous snow pits on the Kaskawulsh Glacier suggested that the 1963 summer could be viewed in terms of a threefold, sequential development of surface and subsurface features related to snowmelt. Stage 1 was characterized by thin ice layers and rounded, medium-grained snow immediately underlying a non-descript snow surface. Stage 2 began on July 1 with a pronounced warm spell. Features characteristic of Stage 2 included surface depressions, ice and slush glands, 'slush columns', and 'slush walls'. Lateral expansion of surface depressions and related subsurface features occurred during Stage 2. By July 21, growth of surface depressions resulted in a snow surface with conspicuous mounds (distinctive for Stage 3), remnants of the inter-depression areas of Stage 2. Stages 1 and 3 began and ended when melt began in the spring and ended in the fall, respectively; the dates of these stages are unknown. (Knapp-USGS)
W71-05097

SNOW FACIES AND STRATIGRAPHY ON THE KASKAWULSH GLACIER,
Vermont Univ., Burlington. Dept. of Geology.
W. Philip Wagner.
In: Icefield Ranges Research Project Scientific Results, Volume 1: American Geographical Society (New York) and Arctic Institute of North America (Montreal), p 55-62, 1969. 8 p, 7 fig, 5 tab, 4 ref.

Descriptors: *Glaciers, *Regimen, *Diagenesis, *Snowmelt, *Ablation, Snowpacks, Seasonal, Geomorphology, Water balance, Ice, Snow, Movement, Climates, Weather, Stratigraphy.
Identifiers: Icefield Ranges (Canada), Snowfields.

Measurements of snow temperature, density, hardness, accumulation, and stratigraphy were made during the 1963 melt season in the accumulation zone of the north and central arms of the Kaskawulsh Glacier, Yukon Territory, Canada. The ablation facies extended from the glacier terminus at 810 m to the firn line at 1990 m. Temperature, hardness, and stratigraphic relationships located the saturation line, which separates wetted and percolation facies, between 2330 m and 2420 m. Significant melt occurred everywhere on the glacier; hence the dry snow facies was precluded. In contrast, the variation of density with altitude, which was found to be gradational across the saturation line, as defined by temperature, hardness, and stratigraphic data, suggests that only one facies (the wetted facies) occurred everywhere in the accumulation zone. However, because density is not thought to be a useful parameter for separating wetted and percolation facies on the Kaskawulsh Glacier, the density data are rejected as a primary parameter. It is concluded on the basis of temperature, hardness, and stratigraphy that both wetted and percolation facies were present. Thus the Kaskawulsh Glacier was subpolar in 1963. (Knapp-USGS)

O-18/O-16 RATIOS IN SNOW AND ICE OF THE HUBBARD AND KASKAWULSH GLACIERS,
Calgary Univ. (Alberta). Dept. of Geology; and Calgary Univ. (Alberta). Dept. of Physics.
D. S. Macpherson, and H. R. Krouse.
In: Icefield Ranges Research Project Scientific Results, Volume 1: American Geographical Society (New York) and Arctic Institute of North America (Montreal), p 63-73, 1969. 11 p, 12 fig, 10 tab, 25 ref.

Descriptors: *Stable isotopes, *Oxygen, *Glaciers, *Regimen, *Water balance, Water sources, Climates, Winds, Precipitation (Atmospheric), Tracers, Distribution patterns, Weather patterns.
Identifiers: *Oxygen isotopes, Icefield Ranges (Canada).

One hundred samples collected from the Hubbard and Kaskawulsh Glaciers in the St. Elias Mountains during the summer of 1963 were analyzed for O-18 and O-16. The delta O-18 values ranged from -18 to -29, with an average of about -23. Pits that were studied before extensive melting showed definite trends in delta O-18 with the more negative values corresponding to winter precipitation. Pits studied later in the season had the seasonal trend masked by the action of downward percolating meltwaters. The average of all pits and boreholes studied above the firn line gave no indication of an altitude variation of delta O-18 larger than the sampling error. A longitudinal profile below the firn line showed much scatter in the value, but the average trend was a decrease in going down-glacier from the firn line to the terminus. A transverse profile below the firn line which sampled three main ice streams gave remarkably consistent values near the margins, whereas the stream centers had decidedly more positive or negative values. These results are considered in terms of accepted modes of glacier flow. Precipitation studies exhibited much scatter and did not show the expected altitude variation. Much of the precipitation in the area is derived from the Pacific Ocean rather than from inland sources. (Knapp-USGS)
W71-05099

HIGH SNOWFIELDS OF THE ST. ELIAS MOUNTAINS,
Cold Regions Research and Engineering Lab., Hanover, N. H.

Edward Grew, and Malcolm Mellor.
In: Icefield Ranges Research Project Scientific Results, Volume 1: American Geographical Society (New York) and Arctic Institute of North America (Montreal), p 75-87, 1969. 13 p, 10 fig, 1 tab, 18 ref.

Descriptors: *Snowpacks, *Solar radiation, *Profiles, Water balance, Stratigraphy, Albedo, Glaciers, Density stratification, Snow cover, Snow surveys, Snowmelt, Infiltration.
Identifiers: *St. Elias Mountains (Canada).

Observations made during the 1964 summer provide a description of snow and radiation characteristics for the St. Elias Mountains and give insight into effects of altitude when anomalous wind and slope effects are excluded. Divide Camp, Seward Camp, and Lucania Camp were occupied successively within a minimum period of time to compare conditions at different altitudes. Data are presented on snow profiles, snow accumulation measurements, the development of the annual snow layer, snow conditions at depth, the mechanical properties of the snow, snow densification, solar radiation, and the variation of snow properties with surface altitude. It is concluded that as long as local anomalies are avoided, the effects of surface altitude on snow properties and surface processes seem to be simple. In Mountain regions it is usually a combination of local conditions which produces the effects. (Knapp-USGS)

ICEFIELD RANGES RESEARCH PROJECT SCIENTIFIC RESULTS, VOLUME 1,
American Geographical Society, New York, and Arctic Inst. of North America, Montreal (Quebec).
Vivian C. Bushnell, and Richard H. Ragle.
American Geographical Society (New York) and Arctic Institute of North America (Montreal), 1969. 224 p.

Descriptors: *Glaciers, Mountains, Climatology, Meteorology, Hydrology, Hydrogeology, Topography, Geomorphology, Limnology, Stratigraphy, Ecology, Projects, Grants, Arctic, Cold regions, Subarctic.
Identifiers: *Snowfields, St. Elias Mountains, Icefield Ranges (Canada), Geography.

The Icefield Ranges Research Project, under the institutional sponsorship of the Arctic Institute of North America and the American Geographical Society, seeks understanding of the natural environment of the St. Elias Mountains of Alaska and Yukon Territory. The project is multidisciplinary in its areas of research, and it is also interdisciplinary in its approach to its objectives. The Icefield Ranges Research Project has now completed eight field seasons, and the contents of this volume are representative of field work performed during the first four, from 1961 to 1965. GREAT LAKES SNOWSTORMS. PART 1. CLOUD PHYSICS ASPECTS,
State Univ. of New York, Albany. Atmospheric Sciences Research Center.
James E. Jiusto, and Edmond W. Holroyd, III.
Available from NTIS as COM-71-00012, $3.00 in paper copy, $0.95 in microfiche. Jun 70. 153 p, 42 fig, 13 tab, 71 ref. ESSA Grant No E22-49-70 (G).
Identifiers: *Cloud seeding, *Great Lakes, *Snowstorms, Reduction, Cloud physics, Silver iodide, Aerosols, Freezing, Condensation nuclei, Atmospheric physics, Temperature, Meteorological radar, Dry ice, Snow fall, Radar cross sections, Networks, Mathematical models, Computer programs, Lake Erie, Lake Ontario, *Lake effect snowstorms.

Studies of the synoptic, mesoscale, and microphysical characteristics of snowstorms occurring to the lee of Lakes Erie and Ontario were done, with emphasis on defining precipitation mechanisms, land structure, aerosol characteristics and snowfall patterns. Cloud seeding was performed with silver iodide and with dry ice. The practical implications of each modification concept cannot be definitely assessed, but seeding with additional freezing nuclei to increase ground or lake precipitation can be accomplished, and seeding from the ground offers experimental and operational advantages. Snow crystal concentration at ground level is an effective measure of modification efficacy. It is recommended that the ground observer network be increased by a factor of 3, and that the duration and area of seeding be increased by at least a factor of 2 to 3.
W71-05153

APPLICATION OF METHOD FOR PREDICTING THERMAL ERROR IN MEASUREMENT OF GROUND TEMPERATURE,
Massachusetts Inst. of Tech., Cambridge. Dept. of Mechanical Engineering.
Warren M. Rohsenow.
Available from NTIS as AD-818 015, $3.00 in paper copy, $0.95 in microfiche. Cold Regions Research and Engineering Lab Technical Report 186, May 1967. 6 p, 8 fig, 1 tab, 1 ref. Army Corp of Eng Contract DA-19-016-ENG-3204.
Identifiers: *Terrain, Surface temperatures, Instrumentation, Probes, Predictions, Errors, Atmospheric temperature, Heat transfer, Measurement, Snow, Ice, Permafrost, Soils.

The use is illustrated of generalized charts in estimating the thermal error in measurement of ground temperature in the case of a probe inserted in a pit wall. The word 'ground' includes snow and ice as well as soil materials. Two major sources of error, other than instrument error, are inherent in this type of measurement. If the air temperature differs from the ground temperature, heat will be exchanged between the air and side walls of the excavation as soon as the pit is opened. The ground temperature must be read before appreciable heat transfer occurs. A second error is introduced upon insertion of the temperature sensing element if the element temperature differs from the ground temperature.
W71-05257

LOW-TEMPERATURE PHASES OF INTERFACIAL WATER IN CLAY-WATERS SYSTEMS,
Cold Regions Research and Engineering Lab., Hanover, N.H.
Duwayne M. Anderson, and Allen R. Tice.
Available from NTIS as AD-715 714, $3.00 in paper copy, $0.95 in microfiche. Research Report 290, Oct 1970. 15 p, 3 fig, 2 tab, 19 ref.
Identifiers: *Clay minerals, Water, *Arctic regions, Construction, Thermal analysis, Interfaces, Frost heave, Freezing, Phase studies, Ice, *Clay water systems, Frozen soils, *Interfacial water.

Low temperature differential thermal analyses of selected clay-water systems were made to locate important phase change temperatures and to define fruitful temperature-pressure fields for precise calorimetric investigation. In addition to an exotherm corresponding to initial freezing, one, two or three exotherms were observed between -35 C and-60 C. The low temperature exotherms do not depend critically upon water content, but clearly they are related to clay mineral and exchangeable cation type. The evolution of heat in this temperature range probably corresponds to a phase change in the interfacial water.

2D. Evaporation and Transpira

A COMPARISON OF ENERGY BAL METHODS FOR ESTIMATING ATMOSPH THERMAL RADIATION,
Agricultural Research Service, Phoenix, Water Conservation Lab.
Keith R. Cooley, and Sherwood B. Idso.
Water Resources Research, Vol 7, No 1, p February 1971. 7 p, 3 fig, 2 tab, 18 ref.

Descriptors: *Solar radiation, *Energy b *Evapotranspiration, Heat budget, Cloud Evaporation, Hydrologic cycle, Transpir Measurement, Data collections, Data process
Identifiers: *Radiation balance.

A radiation balance method and a modified tion balance method were used to determine and daily values of atmospheric thermal rad on three clear and three cloudy days February and March 1970 at Phoenix, Ar The radiation balance was used over surfa bare soil, Bermuda gross, and open wate modified radiation balance was used over the water surface only. The modified radiation ba differed from the pure radiation balance met that net radiation was calculated as the resid the energy equation rather than measured values of atmospheric thermal radiation thu tained were compared to values obtained measurements of incoming, all-wave rad minus incoming solar radiation. The best al tive to the semi-direct measurement of atmosp thermal radiation was the radiation balance the bare soil surface. Results from this m were of sufficient accuracy, even on an hour sis, for most research studies, and were even on a daily basis. Radiation balances over gras water surfaces were somewhat less satisfactor still better than the modified radiation ba method. (Knapp-USGS)
W71-04852

SOME OBSERVATIONS ON THE EFFEC WIND INDUCED THERMAL MIXING,
Saskatchewan Research Council, Saskatoon.
G. Lakshman.
Water Resources Research, Vol 7, No 1, p 194, February 1971. 6 p, 8 fig, 2 ref.

Descriptors: *Evaporation, *Lakes, *M *Winds, *Thermal stratification, Energy bu Water temperature, Radiation, Solar radia Mass transfer, Convection, Advection, Ponds.
Identifiers: Saskatchewan.

Wind induced thermal mixing in a pond or s influences the diurnal variation in the water su temperature. This, in turn, greatly affects the of evaporation from the water surface. The imum diurnal rise in the water temperature pends on the total duration of sunshine, the imum rise in air temperature above the initial temperature, and the wind speed. Sheltering a may increase the rate of evaporation under ce conditions. (Knapp-USGS)

vailable from NTIS as PB-197 735, $3.00 in aper copy, $0.95 in microfiche. Florida Water esources Research Center, Publication No 12, ecember 31, 1970. 41 p, 1 tab, 17 fig, 34 ref. WRR Project A-003-FLA (2).

escriptors: *Irrigation, *Evaporation, Wind elocity, Water temperature, Dew point, Air temerature, *Rates of application, Interception, Irgation efficiency, *Sprinkler irrigation, Florida.
entifiers: Evaporation loss.

ater conservation, distribution of chemicals rough irrigation water and the increasing popuity of low application rate irrigation systems are important factors pointing up the need for more ecision in irrigation management which in turn is pendent upon accurate estimates of expected aporation losses. Data has been obtained to pret the independent effect of water application e, air (wind) velocity, water temperature and y bulb and dew point temperature of the ambient on evaporation losses by water droplets and ter droplets in combination with plant interpted water. By far the most influential factor on aporation losses is the rate of application. Results dicate evaporation losses are about 60% for low plication rates (0.15 iph) with climatic condins typical of Florida and when plant foliage is esent to intercept most of the applied water.

STS OF SOLAR RADIATION MODELS IN REE FOREST CANOPIES,
Diego State Coll., Calif. Dept. of Biology.
C. Miller.
ology, Vol 50, No 5, p 878-885, 1969. 2 fig, 4 , 12 ref.

scriptors: *Solar radiation, *Mathematical dels, Forecasting, Photosynthesis, Primary ductivity, Evaporation.
ntifiers: *Forest canopies, Leaf area.

eral models expressing the decrease of solar iation in vegetation canopies have been posed. The models are similar in (1) including a hod of projecting the shadow of one or more es into a horizontal plane and (2) including a hod of relating the projected shadow to the rease of solar radiation. The models differ in the ations used and in the assumptions made. The dels use the binomial, the Poisson, or some dification of the binomial to relate the projected low to the radiation at different levels. When models were tested against the percentage of it area at different levels in the canopy, the best ng model was one proposed in this paper in ch the shadow of the leaf is projected as a low of a cone and the binomial is used to exs the decrease of radiation. Negative exponenmodels usually overestimated the percentage of Including the shadow cast by twigs and nches in the prediction improved the agreement veen the observed and the expected percentage un. Primary production models in which the ative exponential is used to calculate solar ation may overestimate the actual production.

ANALYSIS OF THE USE OF DISTORTED HYDRAULIC MODELS FOR DISPERSION STUDIES,
California Univ., Berkeley. Dept. of Civil Engineering; and Illinois Univ., Urbana. Dept. of Civil Engineering.
Hugo B. Fischer, and E. R. Holley.
Water Resources Research, Vol 7, No 1, p 46-51, February 1971. 6 p, 3 fig, 8 ref.

Descriptors: *Hydraulic models, *Hydraulic similitude, *Dispersion, *Mixing, *Waste dilution, Steady flow, Unsteady flow, Path of pollutants, Lakes, Rivers, Estuaries, Model studies.
Identifiers: Distorted hydraulic models.

The model ratios applicable to dispersion studies in distorted hydraulic models are investigated for both steady and oscillatory flow, and the effects of both vertical and transverse distributions of velocity on the dispersion process are considered. It is shown that simple transposition of concentration profiles from model to prototype is not valid and that models may magnify or reduce longitudinal dispersion depending on the geometry of the system. For that reason, physical models are unlikely to be useful for studies of pollutant dispersion. (Knapp-USGS)

LAW OF STREAM RELIEF IN HORTON'S STREAM MORPHOLOGICAL SYSTEM,
Hawaii Univ., Honolulu. Water Resources Research Center.
Yu-Si Fok.
Water Resources Research, Vol 7, No 1, p 201-203, February 1971. 3 p, 1 tab, 5 ref.

Descriptors: *Topography, *Geomorphology, *Drainage patterns (Geologic), Statistical methods, Elevation, Erosion, Mapping, Shape, Slopes, Valleys, Mathematical studies.
Identifiers: Stream order.

Within a river basin, the streams can be classified by the Horton-Strahler stream order system. The average stream lengths and slopes are semilogarithmic functions of the stream order. In this study, paralleling Horton's development, the law of stream relief is proposed and the average stream relief is found also to be a semilog function of the stream order. The riverbed profile can be described by a semilog equation expressing stream relief as a function of stream length. The F value in the stream relief equation may be considered as an indicator of the riverbed profile properties. (Knapp-USGS)

WATER RESOURCES OF THE GREAT SMOKY MOUNTAINS NATIONAL PARK, TENNESSEE AND NORTH CAROLINA,
Geological Survey, Washington, D.C.
W. M. McMaster, and E. F. Hubbard.

For sale by US Geological Survey, Washington, DC 20402 - Price $1.50, per set. Geological Survey Hydrologic Investigations Atlas HA-420, 2 sheets, 1970. Text, 13 fig, 2 map, 5 tab, 15 ref.

Descriptors: *Water resources, *Surveys, *Hydrologic data, *Tennessee, *North Carolina, Water resources development, National parks, Hydrogeology, Streamflow, Topography, Water supply, Water yield, Water wells, Water quality.
Identifiers: *Great Smoky Mountains National Park.

The Great Smoky Mountains National Park is located on the Tennessee-North Carolina border in the southern part of the Appalachian Range. In order to plan effectively for the development of new facilities, and the management of the park's resources, the Park Service needs information on how much water is available at different places in the park. This 2-sheet hydrological atlas is intended to satisfy that need. Sheet 1 covers the surface-water resources in the park and sheet 2 the ground-water resources. Emphasis was placed on evaluating the occurrence, availability, and quality of groundwater. An important part of the study is the flow of streams, particularly low flows. Low flows are a limiting factor when developing a stream for water supply. Low-flow data are also essential in stream-pollution studies and for the protection of aquatic life and resident environment. Many recreational uses of the streams also depend on adequate low flows. The park is located in one of the wettest regions of the United States. Precipitation in the park as a whole averages 64 inches annually. Average discharge ranges from less than 2 to more than 4 cfsm. The low flows of the streams are more variable than the average flows. Seven-day, 2-year minimum flows range from less than 0.1 to more than 0.8 cfsm. Availability of groundwater and surface water is shown by maps. Other hydrologic data are summarized in hydrographs, duration curves, graphs, charts, and tables. (Knapp-USGS)

FLOOD OF MARCH 1968 ON THE SUDBURY, ASSABET, AND CONCORD RIVERS, MASSACHUSETTS,
Geological Survey, Washington, D.C.
R. G. Petersen, G. K. Wood, and R. A. Gadoury.
For sale by US Geological Survey, Washington, DC 20402 - Price $1.25 per set. Geological Survey Hydrologic Investigations Atlas HA-371, 2 sheets, 1970. Text, 3 fig, 3 photo, 2 tab, 6 ref.

Descriptors: *Floods, *Massachusetts, *Antecedent precipitation, *Snowmelt, Rainfall-runoff relationships, Surface-groundwater relationships, Hydrologic data, Overflow, Storm runoff, Precipitation (Atmospheric), Flood damage.
Identifiers: *Sudbury River (Mass), *Assabet River (Mass), *Concord River (Mass), *Concord (Mass).

The areas flooded by the Sudbury, Assabet, and Concord Rivers, Massachusetts, in March 1968 are shown by a 2-sheet hydrologic atlas consisting of maps, tables, frequency graphs, hydrographs, and text. During a 3-day period from March 17 to 19, 1968, a total of 3 to 7 inches of rain fell on parts of eastern Massachusetts. This heavy rainfall, combined with the generally wet antecedent conditions of the spring season and some runoff from snowmelt, caused considerable flooding of the rivers in the area. The purpose of this report is to show flood stages and areas inundated by the March 1968 flood, to compare the severity of this flood with past floods, and to show the frequency of floods of given magnitudes which may be expected in the future at gaging stations in the basins. (Knapp-USGS)
W71-04980

FLOOD OF JUNE 1967 AT GRAND ISLAND, NEBRASKA,
Geological Survey, Washington, D.C.
F. Butler Shaffer, and Kenneth J. Braun.
For sale by US Geological Survey, Washington, DC 20402 - Price $0.75. Geological Survey Hydrologic Investigations Atlas HA-352, 1 sheet, 1970. Text, 2 fig, 2 photo, 2 map.

Descriptors: *Floods, *Nebraska, *Antecedent precipitation, Rainfall-runoff relationships, Surface-groundwater relationships, Hydrologic data, Overflow, Storm runoff, Precipitation (Atmospheric), Flood damage.
Identifiers: *Grand Island (Nebr).

Flooding in 1967 at Grand Island, Nebraska is shown by a 1-sheet hydrological atlas consisting of a map of the flooded area, profiles, and text. Rain on June 13-15, 1967, was the immediate cause of widespread flooding in northeastern Hall and western Merrick Counties, Nebr. The inundated areas included parts of the city of Grand Island, (population, 30,675), part of the Cornhusker Ordnance Plant, and extensive tracts of rich agricultural land. The Abbott and Grand Island quadrangles lie almost wholly on the broad, nearly flat floor of the Platte River valley. The flooding occurred in the drainage basins of Wood River, Warm Slough, and Prairie Creek, each of which is tributary to the Platte River downstream from the map area. During the period May 26 to June 12, a succession of rains totaling 7 to 10 1/2 inches fell in the area. Most of the precipitation was absorbed by the terrain. On the thoroughly soaked grounds, 2 to more than 6 inches of rain fell on June 13-15. Extensive flooding was the result. North Channel and Wood River are incised less than 5 feet below the land surface. Because the antecedent precipitation had raised the water table to or above their channel floors, runoff from the additional rain soon had both streams overflowing. (Knapp-USGS)

OCEANIC HEAT CONTENT OFF OREGON: VARIATIONS AND THEIR CAUSES,
Oregon State Univ., Corvallis. Dept. of Ocean raphy.
James G. Pattullo, Wayne V. Burt, and Sally A. Kulm.
Limnology and Oceanography, Vol 14, No 279-287, March 1969. 9 p, 4 fig, 3 tab, 5 ref. Grant GP-5165; ONR Research Contract N 1286 (10).

Descriptors: *Water temperature, *Bathythen graphs, *Sea water, *Oregon, Variability, Oc currents, Currents (Water), Water circulat Oceanography, Statistical methods, Sampling, D collections.

Heat control, surface to 100 m, was computed oceanographic stations within 165 nautical mile the Oregon coast. Mean content, 1962 thro

5, was 100 kg cal per sq m, with a root mean are deviation of 13 kg cal per sq cm. The prinal fluctuation around the mean was seasonal; the sonal range among monthly mean values was ce as large offshore, beyond 100 miles from the st (35 kg cal per sq cm) as the range inshore, in 65 miles of shore (15 kg cal per sq cm). The se of the seasonal variation offshore was local ting, but advection was important inshore. Obed ranges in heat storage inshore were only a d as large as expected from the computed local ting. The results are consistent with inshore curs from the south in winter and coastal uping associated with offshore transport of water heat in summer. Inshore the seasonal regime not dominant; fluctuations of long and short ods and geographical variations were also apciable. (Knapp-USGS)

IE CHARACTERISTICS OF THE THERL REGIME OF RIVERS IN THE DANUBE DNIESTER BASINS,
ainskii Nauchno-Issledovatelskii rometeorologicheskii Institut, Kiev (USSR).
. Dyukel.
et Hydrology, Selected Paper No 4, p 381-387, . 4 fig, 4 tab, 5 ref.

criptors: *Groundwater recharge, *Water temture, River basins, Elevation, Air temperature, rmocline, Temperature, Water pollution ces.
tifiers: *Thermal regime, *Danube river basin, iester river basin.

thermal regime of rivers in the Tissa, Seret, , and Dniester basins is determined by climatic litions and, primarily, by air temperature. After ysing extensive data it is concluded, that when ralizing the characteristics of the thermal ne, allowance must be made for the influence cal conditions, especially for strong groundr recharge and human activity, which are uently more important than climatic factors actually determine the thermal regime in a reach of a water course. For example, the nal regime in a river reach with strong groundr recharge is determined by the percentage temperature of groundwater in the total flow. rivers whose basin is located in the mountains piedmont areas, elevation is an integrating r, determining their thermal regime in reaches moderate groundwater recharge. Groundwater

OSITY AND DISPERSION CONSTANT CULATIONS FOR A FRACTURED CAR-

BONATE AQUIFER USING THE TWO WELL TRACER METHOD,
Geological Survey, Denver, Colo. Water Resources Div.
D. B. Grove, and W. A. Beetem.
Water Resources Research, Vol 7, No 1, p 128-134, February 1971. 7 p, 3 fig, 6 ref.

Descriptors: *Hydrogeology, *Carbonate rocks, *Fractures (Geology), *Tracers, Karst, Groundwater movement, Tracking techniques, Flow nets, Pumping, Withdrawal, Water wells, Aquifers, New Mexico, Limestones, Dispersion, Diffusion, Permeability, Porosity, Storage coefficient, Radioactivity techniques, Tritium.
Identifiers: *Aquifer tests, *Pumping tests.

The time concentration profile from the discharging well of a labeled recharging-discharging well pair is used to evaluate an aquifer's porosity and dispersion constant. The technique is applicable for pulse tracer injection and recirculation. Derived equations allow prediction of streamline arc lengths and travel times between wells along streamlines. Adjacent streamlines joining the two wells define volumes that approximate dispersion columns of known length. The summation of breakthrough curve concentration profiles for flow through these individual columns provides a composite breakthrough curve for the entire flow field. Analysis of a tracer test using tritium in a fractured carbonate aquifer near Carlsbad, New Mexico, provided a dispersion constant of 125 feet and a porosity of 12.0%, values consistent with known properties of the aquifer. (Knapp-USGS)

PERTURBATION SOLUTIONS OF THE DISPERSION EQUATION IN POROUS MEDIUMS,
Technion-Israel Inst. of Tech., Haifa.
Gedeon Dagan.
Water Resources Research, Vol 7, No 1, p 135-142, February 1971. 8 p, 3 fig, 18 ref.

Descriptors: *Dispersion, *Porous media, *Groundwater movement, Equations, Hydrogeology, Darcys law, Mathematical studies, Boundary layers, Flow nets, Flow, Velocity, Percolation, Steady flow, Tracers.
Identifiers: Dispersion equations.

The solution of the dispersion equation for porous media is difficult because of the dependence of the dispersion tensor on the velocity. Approximate solutions of dispersion in nonuniform two-dimensional flows are sought by perturbation expansions. An inner boundary layer solution for the transition zone between two fluids in steady and unsteady conditions is derived. Two examples of dispersion, radial flow and coastal aquifers, are solved approximately. (Knapp-USGS)

Descriptors: *Groundwater movement, *Tracers, *Tracking techniques, Radioactivity techniques, Radioisotopes, Phosphorus radioisotopes, Tagging, Flow, Boreholes, Water wells.
Identifiers: *Radiographic techniques.

A radiographic method for determining the direction and the velocity of groundwater flow was developed. The radioisotope P-32 is injected, as a point or a thin-column source, at the center of the well. The injection is performed at the desired depth without disturbing the water. The radioisotope is left to follow the horizontal flow of water. Some of the P-32 is adsorbed onto the walls of two parallel detecting screens which are separated by a few centimeters and fitted inside the well. Both the inner and outer screens are radiographed; the darkest parts of the emulsions and the north direction marked on another film give the flow direction. The blackening of each film in the screen is measured. Velocities are determined either by the displacement method or from the calibration curve of the velocity versus relative blackening. THE CENOMANIAN-TURONIAN CALCAREOUS AQUIFER OF CENTRAL AND WESTERN GALILEE, ISRAEL,
Geological Survey of Israel, Jerusalem.
U. Kafri.
International Association of Scientific Hydrology Bulletin, Vol 15, No 4, p 77-91, December 1970. 15 p, 7 fig, 3 tab, 31 ref.

Descriptors: *Aquifers, *Water circulation, *Karst, Recharge, Discharge (Water), Water balance, Water circulation, Springs, Permeability, Hydrogeology, Water chemistry, Water quality, Bicarbonates, Salinity, Groundwater movement.
Identifiers: *Israel.

The regional Cenomanian-Turonian aquifer of central and Western Galilee is devided into two partly connected subaquifers. The different rates of karstic erosion in the subaquifers depend on differences in lithology, initial porosity, degree of exposure and structural position. The springs of Western Galilee are natural outlets, some of them draining the lower subaquifer and some the upper one. Those that drain the upper subaquifer show a rapid decay and a good correlation with precipitation. Those of the lower subaquifer show a relatively slow decay and point to a large storage. Replenishment equations, as well as average replenishment estimates, were obtained for three out of five of the springs. The groundwaters of this area are generally of the bicarbonate type with low salinity, typical of an intake area. The salinity increases toward the base levels to the west and the south, where the waters become of the chloride type. In some places the high salinities could be related to the mixing of fresh water with small amounts of sea water. (Knapp-USGS)

MATHEMATICAL MANAGEMENT MODEL--UNCONFINED AQUIFER,
Texas Tech Univ., Lubbock. Water Resources Center; and High Plains Underground Water Conservation District No. 1, Lubbock, Tex.
Albert Sechrist, B. J. Claborn, Frank Rayner, and D. M. Wells.
Available from NTIS as PB-197 788, $3.00 in paper copy, $0.95 in microfiche. Final Report, October 31, 1970. 148 p, 7 tab, 23 fig, 4 append. OWRR Project C-1537 (NO 1993) (1).

Descriptors: *Groundwater, *Groundwater management, *Computer programs, *Recharge, *Model studies, *Mathematical models, Computer models, *Texas, *Aquifers, Aquifer characteristics, Wells, Withdrawal, Drawdown, *Consumptive use, Underground storage.
Identifiers: *Ogallala aquifer, Southern High Plains (Texas).

The numerical model for groundwater flow developed by the California Department of Water Resources (DWR) was adapted to a 2290 square mile region of the Ogallala Aquifer in the Southern High Plains of Texas. A computer program was written to define Theissen type polygons around each of 183 observation wells. Model verification was based on a five year period. Net withdrawals for this period were estimated from consumptive use calculations. The model is more sensitive to net withdrawal variations than to either permeability or storage coefficient variations. Constant values of aquifer properties and a six element consumptive use vector yielded an average error of 0.07 feet after five years, and a standard deviation of 9.1 feet. A recharge operation in one segment of the study area is used as an example of usefulness of the model. (Claborn-Texas Tech)

For sale by Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 - Price $3.75. Geological Survey Research 1970, Chapter D, Professional Paper 700-D, p D257-D261, 1970. 5 p, 1 fig, 8 ref.

Descriptors: *Aquifers, *Utah, Quaternary period, Alluvium, Groundwater, Water resources development, Stratigraphy, Limestones, Clays, Sands, Gravels, Water levels, Transmissivity, Logging (Recording), Subsurface investigations, Hydrogeology.
Identifiers: *Jordan Valley (Utah).

The altitude of the base of the Quaternary deposits in the Jordan Valley, Utah, was determined by interpretation of drillers' logs of water wells supplemented with some geological and geophysical data. The pre-Quaternary surface of the valley generally was similar to the present land surface but had considerably more relief. A map showing contours of the base of the Quaternary deposits can be used as a general guide for water-well drilling and for preliminary determination of the depth to firmest foundation materials. (Knapp-USGS)

A METHOD FOR RELATING INFILTRATION RATES TO STREAMFLOW RATES IN PERCHED STREAMS,
Geological Survey, Tucson, Ariz.
D. E. Burkham.
For sale by Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $3.75. Geological Survey Research 1970, Chapter D, Professional Paper 700-D, p D266-D271, 1970. 6 p, 3 fig, 6 ref.

Descriptors: *Surface-groundwater relationships, *Alluvial channels, *Infiltration, *Recharge, *Permeability, Water levels, Stage-discharge relations, Discharge (Water), Streamflow, Water levels, Unsteady flow, Duration curves, Hydrograph analysis, Conjunctive use.
Identifiers: Perched water.

A method was developed for relating infiltration rates to streamflow rates for streams that are perched above the water table. The equations derived are based on relations of streamflow rates to width, depth, and velocity and on the assumed relations between infiltration velocity and these parameters. The equations were compared to measured streamflow data for a reach of an ephemeral stream entrenched in alluvium. The bed of the stream normally is coated with fine-grained material deposited during periods of low flow. An equation based on the assumption that infiltration velocity is proportional to stream depth seems to correlate closely with infiltration rates during typical short-duration flows. The layer of fine-grained material on the streambed probably is the main control on the infiltration velocity during these flows. (Knapp-USGS)

THE EFFECT OF STREAM DISCHARGE ON STREAMBED LEAKAGE TO A GLACIAL OUTWASH AQUIFER,
Geological Survey, Columbus, Ohio.
Stanley E. Norris.
For sale by Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $3.75. Geological Survey Research 1970, Chapter D, Professional Paper 700-D, p D262-D265, 1970. 4 p, 3 fig, 1 tab, 3 ref.

Descriptors: *Surface-groundwater relationships, *Induced infiltration, *Alluvial channels, *Ohio, Water level fluctuations, Withdrawal, Transmissivity, Glacial drift, Recharge, Discharge (Water), Water yield, Streamflow, Water levels.
Identifiers: *Aquifer testing, *Pumping tests.

Five controlled pumping tests of a glacial outwash aquifer, made in a comparatively small area in the Scioto River valley near Piketon, Ohio, showed ranges in aquifer transmissivity from 165,000 to 300,000 gallons per day per foot and in the streambed leakage from 0.21 to 1.15 mill lons per day per acre for each foot of h ference between the stream and the un aquifer. The rate of streambed leakage var stream discharge and velocity, suggesti higher flows progressively clean the stream increase its permeability. The relation of di to streambed leakage is important not onl design of local groundwater supply facilit also because it may be applicable to a large the watercourse aquifer system in the lowe River valley. STEADY STATE FLOW AROUND A WELL TWO-LAYERED AQUIFER,
Iowa State Univ., Ames. Dept. of Agronomy.
Muhammad Yunus Khan, Don Kirkham, and Toksoz.
Water Resources Research, Vol 7, No 1, p 165, February 1971. 11 p, 7 fig, 2 tab, 1 OWRR Project B-013-IA (4).

Descriptors: *Groundwater movement, *Aqu *Withdrawal, *Hydrogeology, *Drainage Equations, Mathematical studies, Permeal Isotropy, Drawdown, Recharge, Drainage sys Pumping, Subsurface drainage, Water table, rated flow, Computer programs, Steady Uniform flow, Hydraulic conductivity.

dentifiers: Groundwater-soil water relationships.

Theoretical expressions for the hydraulic head and he stream function are derived for three-dimen-ional, axisymmetric steady flow around a well in a wo-layered aquifer. The aquifer receives a steady ertical recharge, and the well is pumped at a con-tant rate; the hydraulic head at the outer cylindri-al boundary is kept constant. Two sets of flow nets nd a table of values are presented to show the ef-ect of hydraulic conductivities of the two layers on low lines, equipotentials, and the height of the ater table. Graphs show the effect of the problem ariables on the height of the water table. (Knapp-SGS)

entifiers: Groundwater-soil water relationships.

theory is presented to determine spacing of entical drainage wells that, by discharging oundwater simultaneously from a layered uifer, will lower a water table to a preassigned vel and maintain it. The theory has been veloped by solving a mathematical boundary lue problem. The wells are located on a certain gular grid, and the aquifer receives a uniform ver-al recharge from rainfall or excess irrigation. The eory shows that the spacing depends on the ckness and hydraulic conductivity of each rmeable layer tapped by the wells, the maximum owable drawdown, the uniform vertical charge, the radius of the wells, and the well grid ometry. A table of values of a function, useful for termining spacing of wells to be tapped in an uifer that may consist of any number of permea-layers, is given. (Knapp-USGS)

GROUNDWATER RESOURCES OF THE CLATSOP PLAINS SAND-DUNE AREA, CLATSOP COUNTY, OREGON,
Geological Survey, Washington, D.C.
F. J. Frank.
For sale by the Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $1.00. Geological Survey Water-Supply Paper 1899-A, 1970. 41 p, 8 fig, 1 plate, 8 tab, 15 ref.

Descriptors: *Water resources, *Groundwater, *Oregon, Hydrogeology, Hydrologic data, Data collections, Geology, Water wells, Aquifers, Aquifer characteristics, Water table, Water yield, Water quality, Chemical analysis, Water pollution sources, Saline water intrusion, Drawdown, Surface-groundwater relationships, Water resources development, Hydrographs.
Identifiers: *Clatsop county (Oregon), Clatsop Plains.

Although the average annual precipitation of the Clatsop Plains is 78.5 inches, the area has some water supply problems. The area is underlain by Tertiary bedrock of low permeability that stores and yields small quantities of groundwater, which may be of poor chemical quality. This Tertiary bedrock furnishes only minor groundwater discharge to maintain the base flow of streams. The lowlands are overlain by extensive deposits of dune and beach sand that can absorb and store a large percentage of the annual precipitation. In the central part of the dune area, the saturated thickness of the sand ranges from 95 to more than 150 feet. Much of the water now being discharged to the ocean could be recovered by pumping. Three test wells drilled are capable of yielding 100 gallons per minute. It is estimated that 2,500 acre-feet of groundwater per year per square mile of area may be available for withdrawal in the 10-square mile area that is most favorable for development. The water from the dune sand is soft to moderately hard, has a low chloride concentration, and is of generally good chemical quality. Groundwater from shallow depths beneath a few swampy areas is brown and contains excessive concentrations of iron. (Woodard-USGS)
W71-05088

ELECTRICAL-ANALOG-MODEL STUDY OF WATER RESOURCES OF THE COLUMBUS AREA, BARTHOLOMEW COUNTY, INDIANA,
Geological Survey, Washington, D.C.
F. A. Watkins, Jr., and J. E. Heisel.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $1.25. Geological Survey Water-Supply Paper 1981, 1970. 22 p, 4 fig, 3 plate, 11 tab, 14 ref.

Descriptors: *Groundwater, *Water resources development, *Analog models, *Indiana, Aquifers, Glacial drift, Aquifer characteristics, Water yield, Specific capacity, Withdrawal, Hydrogeology, Hydrologic data, Water wells, Water levels, Water supply, Forecasting, Water resources.
Identifiers: *Columbus Area (Ind), *Bartholomew County (Ind).

The study area is in part of a glacial outwash sand and gravel aquifer that was deposited in a preglacial bedrock valley. The area extends from the north line of Bartholomew County, Indiana, to the south county line and includes a small part of Jackson County south of Sand Creek and east of the East Fork White River. This report area includes about 100 square miles of the aquifer. Groundwater in the outwash aquifer is unconfined. Results of pumping tests and estimates derived from specific-capacity data indicate that the average horizontal permeability for this aquifer is about 3,500 gallons per day per square foot. An average coefficient of storage of about 0.2 was determined from pumping tests. Transmissibilities range from near zero to about 500,000 gallons per day per foot in the thicker parts of the aquifer. About 800,000 acre-feet of water is in storage in the aquifer. This storage is equivalent to an average yield of 34 million gallons per day for about 21 years without recharge. An electrical-analog model indicates that there is more than enough water to meet the estimated needs of the city of Columbus without seriously depleting the aquifer. The decline in water levels in the Columbus area as predicted by the model for the period 1970-2015 ranged from about 20 feet in the center of the areas of pumping to 3 feet or less in the areas upstream and downstream from these areas of pumping. (Woodard-USGS)
W71-05092

WATER RESOURCES AND GEOLOGY OF GLOUCESTER COUNTY, NEW JERSEY,
Geological Survey, Trenton, N.J.
William F. Hardt, and George S. Hilton.
New Jersey Division Water Policy and Supply Special Report 30, 1969. 130 p, 17 fig, 9 tab, 6 ref.

Descriptors: *Water resources, *Groundwater, *Geology, *New Jersey, Hydrologic data, Water wells, Aquifers, Water yield, Water quality, Data collections, Water levels, Hydrology, Pumping, Water utilization, Water users, Consumptive use, Hydrographs, Aquifer characteristics, Surface waters, Streamflow, Drainage, Low flow, Water table, Precipitation (Atmospheric), Surface-groundwater relationships.
Identifiers: *Gloucester County (N.J.).

Gloucester County, in the southwestern part of New Jersey adjacent to Philadelphia, Pa., Camden, N. J., and Wilmington, Del. in the lower Delaware River valley, has an area of 339 square miles. It is in the Coastal Plain physiographic province and is underlain by unconsolidated sand and clay of Quaternary, Tertiary, and Cretaceous age. These sediments overlie bedrock which consists of metamorphic and igneous rocks of upper Precambrian age. The most important and productive aquifer is the undifferentiated Raritan and Magothy Formations of Late Cretaceous age. The aquifer yields about 75 percent of the groundwater used in the county. Wells tapping this aquifer yield up to 1,400 gpm (gallons per minute). Total groundwater pumpage in the county (1966) was estimated at about 40 mgd which consisted of 15.5 mgd for industrial use; 11 mgd for public supplies; 10 mgd for irrigation; and 3.5 mgd for rural domestic supplies. The chemical quality of groundwater is generally acceptable for most uses, although in some areas objectionable amounts of iron, nitrate, and fluoride are found. Near the Delaware River and in the southeastern part of the county, chloride in the water from the Raritan and Magothy Formations may be a future problem. (Woodard-USGS)

APPROXIMATE SOLUTION OF THE NAVIER-STOKES EQUATIONS FOR FLOW THROUGH A RECTANGULARLY PACKED BED OF SPHERES,
Idaho Univ., Moscow. Dept. of Agricultural Engineering.
William McKinley Carson.
PhD Thesis, Idaho University, August 1970. 180 p, 26 fig, 3 tab, 58 ref, 3 append. OWRR Project A-025-IDA (1).

Descriptors: *Groundwater movement, *Numerical analysis, *Computer programs, Equations, Flow, Porous media, Reynolds number, Velocity, Viscosity, Mathematical studies, Percolation, Approximation method.
Identifiers: *Navier-Stokes equations.

Approximate solutions for the Navier-Stokes equations describing fluid flow through a rectangular packing of spheres were obtained for Reynolds numbers of 0.1, 1, 7 and 35. The solutions are based on an Oseen linearization of the full Navier-Stokes equations. The solutions were approximated by triple trigonometric series and the unknown coefficients evaluated using the Galerkin method for error distribution. Friction factors for the packed bed and superficial velocity were evaluated from the velocity functions and are shown to agree with the experimental observations of previous investigators. Based on friction factor and superficial velocity, the Oseen linearization is shown to be valid for packed flow at Reynolds number of 35. (Knapp-USGS)

HYSTERESIS DURING INFILTRATION AND REDISTRIBUTION IN A SOIL COLUMN AT DIFFERENT INITIAL WATER CONTENTS,
Grenoble Univ. (France). Dept. of Hydrology.
Georges Vachaud, and Jean-Louis Thony.
Grant 69-01-666 from General Delegation of Scientific and Technical Research, Paris. Water Resources Research, Vol 7, No 1, p 111-127, February 1971. 17 p, 15 fig, 34 ref.

Descriptors: *Hysteresis, *Infiltration, *Evaporation, *Percolation, *Soil water movement, Unsaturated flow, Hydraulic conductivity, Soil physical properties, Saturated flow, Permeameters, Recharge, Soil moisture meters, Nuclear moisture meters, Tensiometers, Gamma rays, Moisture content.
Identifiers: Soil water redistribution.

Experimental results dealing with flow processes involving hysteresis effects in the suction-water content relationship were obtained on a vertical column of soil submitted to the following successive controlled flow conditions: (1) redistribution of water following a constant head infiltration in an initially air-dried column, (2) constant head infiltration followed by redistribution, and (3) constant flux infiltration followed by controlled evaporation and redistribution. Water contents were measured by using gamma ray attenuation, and water suctions were obtained simultaneously from 10 pressure transducers distributed along the soil column, each one being connected to a tensiometer. All the data were punched on tape and treated with a computer. Examination of the changes of water content and water suction at a given depth yielded precise information on hysteretic behavior. The scanning curves for a single reversal can be defined uniquely with reference to the transition water content, the independent domain theory appears to be inadequate for describing soil water hysteresis completely, and hydraulic conductivity can be considered practically unique. ilable from NTIS as COM-71-00049, $3.00 in er copy, $0.95 in microfiche. Economic elopment Administration Report, ACOMM-70-015, Sept 1970. 233 p.
tifiers: *Fisheries, Economic development, tfishes, *Aquaculture, Surveys, Methodology, ding stuffs, Harvesting, Processing, Marketing, d services, Ponds, Lakes, Equipment, Statisti-lata, Profits, *Fish farms.

history and current state of the industry, im-vement of harvesting methods and equipment, present and future markets including pay-lakes restaurants are reported. Research results are rted as regards catfish processing and feed-'s and diets for catfish. A survey of fish farming 2 states revealed that adult catfish were being ed on 30,330 acres, minnows on 26,866 acres, fingerling catfish on 6,782 acres. The states of issippi and Arkansas account for 75 percent of adult catfish, 74 percent of the fingerling cat-and 83 percent of the minnow acreages. There 804 fish farmers cultivating adult catfish, 429 ng fingerling catfish, and 292 rearing minnows. weighed mean stocking rate was 1,763 fish per while the module stocking rate was 1,500 fish acre. Only 23 fish farmers gave data on king rates for fingerling catfish and the weighed n stocking rate reported by them was 27,468 per acre.

DEVELOPMENTAL HISTORY OF SCHOHSEE SHOWN BY MICROSCOPICAL AND CHEMICAL INVESTIGATIONS, (IN GERMAN),
Max-Planck-Institut fuer Limnologie zu Ploen (West Germany).
Massoud A. H. Saad.
English summary. Archiv fur Hydrobiologie, Vol 67, No 1, p 32-77, 1970. 23 fig, 1 tab, 75 ref.

Descriptors: *Productivity, *Lakes, Allogenic succession, Geologic time, History, Dating, Analysis.
Identifiers: *Schohsee (Germany).

Long core samples were collected from the bottom of the Schohsee with a modified Livingstone corer. The results of pollen and chemical analyses indicated that since its origin in the late glacial time up to the Boreal period the lake had a relatively low productivity. The biogenci production increased considerably in the Atlanticum. The limnological quality of the lake persisted for about 5000 years, but in the Subatlanticum had undergone a gradual decline. In the beginning of this century, the autochthonous production was augmented by eutrophication caused by human activity. (Wilde-Wisconsin)

A PALEOHYDROLOGIC MODEL FOR MINERALIZATION OF THE WHITE PINE COPPER DEPOSIT, NORTHERN MICHIGAN,
Geological Survey, Beltsville, Md.
Walter S. White.
Economic Geology, Vol 66, No 1, p 1-13, January-February 1971. 13 p, 3 fig, 4 tab, 18 ref.

Descriptors: *Paleohydrology, *Mathematical models, *Groundwater movement, *Ion transport, *Water chemistry, Aqueous solutions, Geology, Copper, Geochemistry, Mineralogy, Michigan, Leaching, Water circulation.
Identifiers: *Copper ores, Keweenawan rocks.

Physical properties of the upper Keweenawas rocks can be measured or inferred within a sufficiently narrow range for quantitative evaluation of various paleohydrologic models for the origin of the White Pine copper deposit. The models involve lateral migration of fluids through the subjacent Copper Harbor Conglomerate to the site of the deposit, and stripping of copper from these solutions in the Nonesuch Shale. The calculations reveal limitations to theories of origin that would not be evident from purely qualitative consideration; some of these limitations could be useful to exploration. For example, if the water was yielded by compaction of the Copper Harbor Conglomerate and contained 50 ppm Cu, there must have been significant convergence of solution paths toward White Pine. Surface water entering the Copper Harbor Conglomerate on the north limb of the Lake Superior syncline is an adequate source if the point of entry was once significantly higher than the water table at White Pine; this model implies a major copper deposit at great depth north of the axis of the syncline. Groundwater entering the Nonesuch Shale up dip from White Pine is not a possible source of mineralizing solutions. (Knapp-USGS)

A secondary perturbation of trough has been found in some deep cyclonic systems which appears to play an important role in mesoscale lake effect storms. In two cases such a trough's associated positive vorticity field provided organized ascent in the region between 850 mb and 600 mb. In the November 1967 storm, air parcels traveling between the 850 mb and 700 mb levels underwent one to six thousand foot ascents. This ascent, in turn, provided a moist environment which enhanced cloud growth, nearly doubling cloud depths in the 1968 case. While examining synoptic-mesoscale interactions, it is equally important to recognize the role played by organized descent over a particular lake. Subsidence commonly occurs in the negative vorticity area located ahead of the secondary trough and behind the cold front. This descent is envisioned as effectively capping convective motions at the resulting inversion while drying out the environment beneath the stable layer. A numerical model now being developed will provide an important input of initial and changing boundary conditions for complementing meso- and microscale studies. The model's predicted vorticity field at three hour intervals will yield a measure of the changing values of a synoptically imposed vertical motion pattern, plus its subsequently created moisture environment.

THE TEMPERATURE STRUCTURE OF A MID-LATITUDE, DIMICTIC LAKE DURING FREEZING, ICE COVER, AND THAWING,
Cold Regions Research and Engineering Lab., Hanover, N.H.
W. H. Parrott, and W. M. Fleming.
Available from NTIS as AD-715 716, $3.00 in paper copy, $0.95 in microfiche. Research Report 291, Nov 1970. 21 p, 17 fig, 1 tab, 32 ref.
Identifiers: *Lakes, Temperature, *Ice, Lakes, Freezing, Melting, Thermocouples, Cooling, Thermal properties, Ice formation, Ice breakup, Limnology.

The temperature structure of Post Pond, a small (46.6 hectares), mid-latitude, dimictic lake in west-central New Hampshire, was studied during autumn, winter and spring of 1968-1969. The lake was instrumented over its maximum depth (11.7 m) with a string of 24 thermocouples which recorded hourly temperatures. Temperatures in 9 m of sediments underlying the lake were measured with a thermistor probe. Secondary and tertiary thermocline development in the epilimnion occurred during short warming periods in the early autumn. The autumn overturn lasted 25 days, whereas the spring overturn lasted only 4 days. The entire lake mixed isothermally in the autumn to 3.2 C. During the period of ice cover, the lower 5 m of water gained approximately 51.5 cal/cm sq, which was supplied by stored heat in the bottom sediments. A steady-state thermal gradient of 0.07 deg C/m was found for the deeper sediments underlying the lake during ice cover. Late winter cooling of bottom water under the ice cover may be the result of snowmelt in areas adjacent to the lake causing activation of groundwater influx. Melting of the clear ice portion of the ice cover was primarily the result of heat supplied to the lake from snowmelt water, and occurred on the underside of the ice sheet. Thermal instability of the water mass persisted for 9 days during peak snowmelt runoff; this can be partially explained by an increase in dissolved solids with depth.

2I. Water in Plants

ON THE NUTRITION AND METABOLISM OF ZOOPLANKTON. VII. SEASONAL SURVEY OF NITROGEN AND PHOSPHORUS EXCRETION BY CALANUS IN THE CLYDE SEA-AREA,
Marine Biological Association of the United Kingdom, Plymouth (England). Lab.; and Marine Biological Station, Millport (Scotland).
E. I. Butler, E. D. S. Corner, and S. M. Marshall.
Journal of the Marine Biological Association of the United Kingdom, Vol 50, No 2, p 525-560, 1970. 5 fig, 9 tab, 43 ref.

Descriptors: *Zooplankton, *Metabolism, *Absorption, Exudation, Nitrogen, Phosphorus, Consumptive use.
Identifiers: *Winter feeding, Calanus finmarchicus, Calanus helgolandicus.

Body weight, nitrogen, phosphorus, and levels of nitrogen and phosphorus excretion were determined in females, males and stage V of Calanus finmarchicus and C helgolandicus. Maximum of plant food in terms of chlorophyll a was observed in early April, mid-May, and early September. Excretion of nitrogen and phosphorus was at its peak in April. The rate of excretion was correlated with the level of nutrients. The sex and age of animals did not influence significantly the nitrogen: phosphorus ration. In late April, 26.8% of the captured nitrogen and 17.2% of phosphorus were invested in growth. The findings suggest that the concept of superfluous feeding is not applicable to Calanus during the spring period. (Wilde-Wisconsin)
W71-04965

SEASONAL CHANGES OF CALORIC VALUES OF LAKE PLANKTON, (IN RUSSIAN),
Minsk Univ. (USSR).
A. P. Ostapenya, and Yu G. Giginyak.
Doklady Akademii nauk BSSR, Vol 14, No 1, p 77-79, 1970. 1 fig, 1 tab, 6 ref.

Descriptors: *Plankton, *Energy, *Lipids, Ecosystems, Copepods, Organic matter, Daphnia.
Identifiers: *Caloric values, Belorussian lakes, Cladocerans, Diaptomus graciloides, Daphnia cucullata, Daphnia hyalina, Oscillatoria rubescens, Subglacial flowering, Winter maxima.

The caloric values of organisms serve as important indicators in appraisals of energy relations of planktonic ecosystems. In this study of Belorussian lakes of different trophic levels, the calories of copepods and cladocerans were determined during different periods of the year by a modified method of dichromate oxidation. Regardless of the nature of water, caloric value of organic matter attained its maximum in February. The high caloric values are attributed largely to accumulation of lipids in the bodies of organisms, increasing with lower temperatures from about 10 to 40%. (Wilde-Wisconsin)

PRIMARY PRODUCTION MEASUREMENTS ON A NATURAL PLANKTON BLOOM,
Bedford Inst., Dartmouth (Nova Scotia). Marine Ecology Lab.
Trevor Platt, and D. V. Subba Rao.
Journal Fisheries Research Board of Canada, Vol 27, No 5, p 887-899, 1970. 2 fig, 2 tab, 26 ref.

Descriptors: *Primary productivity, *Phytoplankton, *Measurement, Plankton, Test procedures, Cultures, Laboratory tests.
Identifiers: Phytoplankton blooms, Caloric values, Trichromatic equations.

The samplings were made one mile from the shore of Nova Scotia at six depths from 1 to 40 meters. Analyses included determinations of primary production by the in situ C-14 method, photosynthesis: respiration and chlorophyll c: chlorophyll a ratios, particulate carbon, ash content, phosphorus, silica, nitrates, incident radiation, and transparency. The observations suggested that culture trails provide satisfactory analogues of natural plankton systems under bloom conditions. As inferred from calorific values, phytoplankton in senescent stages of the bloom has no tendency to store fat. No single quantity served as an indicator of the physiological vigor of the plant community. (Wilde-Wisconsin)

Descriptors: *Salt marshes, *Photosynthesis, *Halophytes, *Saline water, *Respiration, Carbon dioxide, Laboratory tests, Mode of action, Physiological ecology, Root systems, Environmental effects, Metabolism, Stomata.

Coastal salt marsh plants live in an environme characterized by sudden and extreme changes salt concentrations. The effects of sudden s salinity changes on photosynthesis and respirati were compared in a halophytic species and a n halophytic species. Plants of Limonium calif nicum (a salt-marsh halophyte) and Phaseolus v garis were cultivated under identical conditio and suddenly subjected to sea water around th root systems. Carbon dioxide consumption production was measured for 20 hrs. in the li and in the dark. Both species showed initial creases in photosynthetic rates immediately af introduction of sea water. In the case of Limoniu photosynthesis was 85% of the initial rate 17 h later, while respiration declined steeply, follow by a strong recovery 4.5 hrs. later. With Phaseol photosynthesis declined steeply after the initial crease and this was paralleled by a decline respiration. It is felt that the initial photosynthe decrease resulted from temporary stomatal ope ing due to decreased water uptake in Phaseolus. contrast, the halophyte was able to maintain re tive stability through some unknown mechanism. does possess salt glands, which may have facilitat adjustment to the new osmotic conditions. SPLASH AMOUNTS FROM WATERDROP IM PACT ON A SMOOTH SURFACE,
Agricultural Research Service, Morris, Minn. So and Water Conservation Research Div.
Calvin K. Mutchler.
Water Resources Research, Vol 7, No 1, p 195 200, February 1971. 6 p, 3 fig, 3 tab, 5 ref.

Descriptors: *Impact (Rainfall), *Hydrauli models, *Raindrops, Rainfall, Laboratory tests Velocity, Depth, Ponding, Soil erosion, Simulate rainfall, Rainfall simulators.
Identifiers: *Raindrop impact, *Splash erosion.

The mechanics of raindrop splash erosion of soi were investigated by using waterdrops impacting a terminal velocity onto various depths of water ove smooth glass. Splash weight produced by water drop impact varied with waterdrop diameter D and surface water depth d. For a smooth hard surface predicted splash in terms of waterdrop weight wa zero at d/D—0 and increased to a maximum at d/D of 0.14 and 0.20 for D—0.559 cm and 0.296 cm respectively. The influence of greater depth became relatively insignificant at a depth of about three drop diameters. (Knapp-USGS)

SIMULATION MODEL OF A COMPLEX CURVED SPIT,
ttingham Univ. (England). Dept. of Geography.
chlaine A. M. King, and M. F. McCullagh.
rnal of Geology, Vol 79, No 1, p 22-37, January 1. 6 p, 8 fig, 2 tab, 3 ref.

scriptors: *Simulation analysis, *Sand spits, nd bars, *Mathematical models, Littoral drift, als, Waves (Water), Winds, Currents (Water), morphology, Surf, Shores, Computer pro-ms.
ntifiers: Hurst Castle spit (England).

imulation model of a coastal spit is presented to strate the value of such models in studying the cesses that lead to spit formation. Hurst Castle in Hampshire, England was chosen for the del because it has a distinctive form due to the ration of several easily identified wave types. e main ridge, which is composed of shingle, is gthened by westerly waves, while storm waves d it up. The recurves are formed of material ted round the end of the main ridge by waves n the south. Waves from the northeast, coming vn the Solent, build the lateral recurves. These ome longer and more numerous toward the al end of the spit. The computer program simu-s the operation of waves from the west, storm es, southeasterly waves, and waves from the theast. In addition, a depth factor simulates the easing depth of water offshore. This accounts the increase in number of recurves toward the al end. A refraction factor allows the curvature he main ridge to be simulated. The proportion andom numbers allocated to these variables can djusted in the data input to elucidate the part play in the formation of the spit. The close fit he standard spit to the real spit suggests that the trolling variables are being correctly simulated. app-USGS)

E MULTIPLE CAUSALITY OF BARRIER ANDS,
stern Washington State Coll., Bellingham. Dept. eology.
rice L. Schwartz.
Journal of Geology, Vol 79, No 1, p 91-94, January 1971. 4 p, 3 fig, 13 ref.

Descriptors: *Sand spits, *Sand bars, *Sedimentation, Sedimentary structures, Coast, Beaches, Deposition (Sediments), Sediment transport, Waves (Water), Geomorphology, Littoral drift, Winds, Currents (Water), Surf, Shores.
Identifiers: Barrier islands.

There is wide disparity in the current literature concerning the origin of barrier islands. The acceptance of multiple causality is advocated here, and a new classification is proposed. Three basically different explanations of the formation of barrier islands are proposed: (1) upbuilding of offshore bars; (2) cutting of inlets through spits; and (3) submergence of ridgelike coastal features. It is feasible that any of these causes, proceeding independently or in concert, can form barrier islands. (Knapp-USGS)

GLASSY OBJECTS IN TERTIARY DEEP-SEA CLAYS CORED BY THE DEEP SEA DRILLING PROJECT,
Scripps Institution of Oceanography, La Jolla, Calif.
C. C. Von Der Borch.
Marine Geology, Vol 10, No 1, p 5-14, January 1971. 10 p, 4 fig, 3 tab, 13 ref.

Descriptors: *Bottom sediments, *Pacific Ocean, *Mineralogy, *Igneous rocks, Clays, Cores, Volcanoes, Petrology, Sedimentation.
Identifiers: *Glass (Volcanic).

Small glassy spheres, ellipsoids, teardrops, cylinders and dumbbells occur in large numbers in Tertiary deep sea clays cored in the northeastern Pacific by the Deep Sea Drilling Project. These objects morphologically resemble microtektites, but have the composition of an oceanic tholeiite. On the basis of their composition and stratigraphic relationship it is considered that they are of volcanic origin and most likely have been formed in deep water by submarine volcanic processes. (Knapp-USGS)
W71-04874

MINERALOGY AND DIAGENESIS OF SOME SOUTH AFRICAN COASTAL AND MARINE CARBONATES,
Cape Town Univ., South Africa. Dept. of Geology.
W. G. Siesser.
Marine Geology, Vol 10, No 1, p 15-38, January 1971. 24 p, 6 fig, 3 tab, 23 ref.

Descriptors: *Beaches, *Bottom sediments, *Calcite, *Diagenesis, Carbonates, Magnesium carbonates, Mineralogy, Ion exchange, Distribution patterns, Dunes, Sands, Geochemistry.
Identifiers: *Aragonite, South Africa.

The dominant carbonate minerals in South African dune, beach, coastal bay, continental shelf, and upper slope environments are aragonite and low-magnesian calcite. In the area studied, there is little difference between the carbonate mineralogy of the beaches and dunes, but the beach-dune environment contains considerably more aragonite and less low-magnesian calcite than the marine environment. Mean high-magnesian calcite values are strikingly uniform for all environments, differing less than 1% between the marine and beach-dune environments. High-magnesian calcite, which is considered the most sensitive mineral to diagenetic changes, shows no mineralogic alteration in the beach-dune environment, but does in sediments presently in the marine environment. Diagenetic alteration of high-magnesian calcite to low-magnesian calcite occurred as a result of prolonged subaerial exposure of the continental shelf during Pleistocene sea-level fluctuations. Recent beach-dune sediments have not been sufficiently isolated from the marine environment to allow alteration of high-magnesian calcite. (Knapp-USGS)
W71-04875

SAND WAVES IN THE SOUTHERN BIGHT OF THE NORTH SEA,
Rijkswaterstaat-Deltadienst, Hague 9netherlands).
J. H. J. Terwindt.
Marine Geology, Vol 10, No 1, p 51-67, January 1971. 17 p, 8 fig, 4 tab, 11 ref.

Descriptors: *Sand waves, *Ripple marks, *Bottom sediments, *Continental shelf, Sedimentary structures, Currents (Water), Waves (Water), Storms, Sands.
Identifiers: *North Sea.

North of the Hinder Banks of the North Sea, sand waves are found, 3-15 m high, with the steep side to the south. Further to the north the steep sides of the sand waves are directed northward. There is no explanation as yet for this phenomenon. In one location it was observed that the height of the sand wave crests is related to the frequency of occurrence of heavy gales and the length of calm weather periods. The maximum observed variation in the height of the sand wave crests was about 2 m. Wandering mega-current ripples (height 0.2-2 m) were observed on the flanks of the sand waves. The crests of these current ripples often make an angle with the sand wave crests. In many locations it was observed that the travelling direction of these ripples (according to their asymmetry) is directed towards the crest of the sand wave from both sides. The grain size differs significantly from one place to another. (Knapp-USGS)
W71-04876

A CLAY MINERAL INVESTIGATION OF SIX CORES FROM THE GULF OF MEXICO,
Research Council of Alberta, Edmonton; and Texas A and M Univ., College Station. Dept. of Soil and Crop Sciences.
D. W. Scafe, and G. W. Kunze.
Marine Geology, Vol 10, No 1, p 69-85, January 1971. 17 p, 8 fig, 3 tab, 21 ref.

Descriptors: *Bottom sediments, *Gulf of Mexico, *Mineralogy, *Clay minerals, Montmorillonite, Kaolinite, Illite, Sands, Silts, Quartz, Clays, Provenance, Differential thermal analysis, X-ray diffraction, Particle size, Centrifugation.
Identifiers: Chlorite, Feldspars.

Samples were studied from each color change in six gravity cores from nearshore to deep-sea areas in the Gulf of Mexico. Analytical methods and techniques used to characterize the sediments were X-ray diffraction, differential thermal analysis, cation exchange capacity, particle size distribution and fractionation of the clay-size material with the supercentrifuge. The clay minerals and semi-quantitative estimates of their abundance suggest that the sum of source conditions has remained constant during and since Pleistocene time represented by the cores in this study. Montmorillonite and kaolinite are not more abundant in warm water than in cold water sediments and illite and chlorite are not more abundant in cold water than in warm water sediments from the Gulf of Mexico. Silt and clay-size materials are approximately equal except for the cores farthest from the Mississippi Delta where clay-size material dominates. In the clay-size fraction, montmorillonite is generally more abundant than illite, while daolinite comprises less than 20% and chlorite less than 7%. Quartz and feldspar exist only in the 2-0.2 micron portion of the clay-size fraction. (Knapp-USGS)

ATLANTIC CONTINENTAL SHELF AND SLOPE OF THE UNITED STATES -- GRAVELS OF THE NORTHEASTERN PART,
Geological Survey, Washington, D.C.
John Schlee, and Richard M. Pratt.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402 - Price $2.00. Geological Survey Professional Paper 529-H, 1970. 39 p, 18 fig, 5 plate, 101 ref.

Descriptors: *Sediment transport, *Gravels, *Northeast U. S., *Continental shelf, *New England, Continental slope, Alluvium, Glaciers, Geomorphology, Glacial drift, Sediments, Particle size, Soil types, Rocks, Lithification, Sedimentary rocks, Sedimentology, Petrography.
Identifiers: *Gulf of Maine, Scotian Shelf, Georges Bank.

This report investigates (1) the patterns of gravel dispersal, (2) the processes of gravel deposition, and (3) the bedrock geology of the Gulf of Maine. Gravel has been deposited on the continental margin off New England (1) in the Gulf of Maine-Scotian Shelf-Georges Bank complex and (2) as scattered patches on the continental shelf south of New England and east of New Jersey. The greatest amounts and largest sizes of gravel are in the exit channels (Great South Channel and Northeast Channel) from the Gulf of Maine that flank Georges Bank. The gravel on the Scotian Shelf is intermediate between that of the Gulf of Maine and Georges Bank. Till-like sediment is near better sorted gravelly sand. Pebble roundness is variable. Pebbles are granitic south of Nova Scotia but are mixed with schist and gneiss. Schist and gneiss are more prevalent southwest of Nova Scotia. (Woodward-USGS)

CLAY MOBILITY IN LANDSLIDES, VENTURA, CALIFORNIA,
Columbia Univ., New York. Dept. of Geology; and Getty Oil Co., Ventura, Calif. , Dept. of Engineering.
Paul F. Kerr, Robert A. Stroud, and Isabella M. Drew.
American Association of Petroleum Geologists Bulletin, Vol 55, No 2, p 267-291, February 1971. 25 p, 24 fig, 4 tab, 15 ref.

Descriptors: *Landslides, *Clay, *California, Soils, Mass wasting, Creep, Movement, Mudflows, Soil erosion, Soil conservation, Groundwater movement, Soil mechanics, Drainage programs, Infiltration.
Identifiers: *Ventura oil field (Calif), *Landslide control.

Landslides cover about 345 acres, or 45% of the eastern producing area of the Ventura Avenue oil field, California. By the end of 1969, 61 oil wells were destroyed by landslide activity. A major slide in January 1968 involved more than 1 million cu yd of material and traveled 100 ft within a few minutes. In general, however, slides have been controlled and movement has been slow. The landslides occur mostly in massive granular sandstones of the middle Pico Formation (Pliocene) which are intercalated at irregular intervals with clay-bearing strata. The sandstone is a granular and poorly cemented subangular, porous arkose. Clay strata are ordinarily thin but contain substantial amounts of montmorillonite with some illite and a minor content of kaolinite. The clay-water mixture probably is the most important factor in landslide mobility at Ventura, although slope, structure, and compaction require proper consideration. For the most part, control of moisture has proved to be the most rewarding measure. (Knapp-USGS)

ANALYSIS OF SCALLOP PATTERNS BY SIMULATION UNDER CONTROLLED CONDITIONS,
University of Western Ontario, London. Dept. of Geography, and McMaster Univ., Hamilton (Ontario). Dept. of Geography.
M. F. Goodchild, and D. C. Ford.
Journal of Geology, Vol 79, No 1, p 52-62, January 1971. 11 p, 5 fig, 3 tab, 14 ref.

Descriptors: *Erosion, *Karst, *Limestones, *Caves, Ripple marks, Subsurface drainage, Carbonate rocks, Weathering, Water chemistry.
Identifiers: Erosion (Solution), Scallop patterns (Erosion).

Working with plaster of paris in an experimental flume, the formation of scallop patterns, a feature of eroded limestone, was simulated under controlled conditions of velocity and viscosity. Analysis of the resulting scallop lengths as a frequency distribution shows that some of the statistical parameters are well correlated with the hydrodynamic conditions. Length is inversely related to velocity and directly to viscosity. These results are similar to those found in a theoretical dimensional analysis of the simpler flute problem. Observations in limestone caverns show that these results apply to scallops generated on limestone. (Knapp-USGS)

TRACE ELEMENT AND ORGANIC CARBON ACCUMULATION IN THE MOST RECENT SEDIMENTS OF SOUTHERN LAKE MICHIGAN,
Illinois State Geological Survey, Urbana.
N. F. Shimp, J. A. Schlekher, R. R. Ruch, D. B. Heck, and H. V. Leland.
Illinois Geological Survey Environmental Geology Notes, No 41, January 1971. 25 p, 18 fig, 3 tab, 5 ref.

Descriptors: *Bottom sediments, *Sediments, *Trace elements, *Carbon, *Lake Michigan, *Data collections, Sampling, Chemical analysis, Cores, Clays, Evaluation.
Identifiers: *Recent sediments, Tables of data.

Trace elements were determined in 21 grab samples and in sections of 21 cores collected from southern Lake Michigan. In all, 119 sediment samples were analyzed for 13 trace elements, organic carbon, and clay. Bromine, chromium, copper, lead, and zinc are concentrated in the uppermost, or recently deposited, portions of organic-rich, fine-grained, southern Lake Michigan sediments. High concentrations of these elements correlate more closely with the amounts of organic carbon present than with clay-size material, water depth, iron oxide, or manganese oxide. Off major river mouths, trace elements have accumulated to greater depths within the sediments in deeper regions of the lake, which is probably a result of high depositional rates associated with the river sediment load. Trace elements showing little accumulation in the recently deposited sed are beryllium, boron, cobalt, lanthanum, ganese, nickel, scandium, and van (Woodard-USGS)

Identifiers: *Western U.S.

Five major playa-surface types were observe Rogers Playa and Rosamond Playa, California a surface of 'mud curls' or fragments of con upward mud polygons, (2) a smooth, hard, pact surface, (3) an irregular puffy surface higher porosity than the smooth surface, transitional surface containing areas of both smooth and the puffy surfaces, and (5) a gene smooth surface characterized by a white cru salt and carbonate. The surface types changed

year to year primarily because of surface-water floodings. Soil moisture contents of samples from test holes showed (1) a general downward increase of moisture in fine-grained sediments of the same size, (2) a decrease of moisture content where the sediments became more silty and sandy, and (3) a decrease of moisture in some clays and silts resting above sand zones. Increasing desiccation of the fine-grained deposits accompanied by the lowering of potentiometric levels has been an important factor in the continued formation of giant desiccation polygons on Rogers Playa. Identifiers: *Western U.S.

Coyote Lake, California occupies the central portion of a basin bounded on the north, west, and east sides by mountains of moderate relief and on the south side by a broad plain extending to the Mojave River. The areas surrounding the playa show evidence of a former, perennial lake. The lake sediments underlying the playa are very fine-grained and compact, and have clay contents as high as 57%. Changes of the playa surfaces result from moisture changes of the clays near the surface due to floodings of the playa. Most of the playa has a smooth, hard surface, but in some areas soft, dry, puffy surfaces occur. The extent and nature of these two surface types change with time. Although puffy surfaces commonly are associated with groundwater discharge on other playas, water from depth beneath Coyote Lake is supplying little moisture to the clays. The playa surface has giant desiccation fissures which intersect and form polygons ranging from 100 to 300 feet across. The majority are relict fissures, filled with sediment. The playa is not aggrading permanently, although material is brought to the playa during periodic flooding. The presence of loose, coarse detritus on the clay surface suggests that the fine materials are deflated. (See also W71-05073) (Knapp-USGS)

In: Geology and Hydrology of Selected Playas in Western United States, Massachusetts University, Geology Department, Final Scientific Report (Part II), to Air Force Cambridge Research Laboratories (AFCRL-69-0214), Chapter 3, Pt. 2, p 108-136, May 1970. 29 p, 10 fig, 7 ref.

Descriptors: *Playas, *Sedimentation, Lake basins, Geomorphology, Deserts, Evaporation, Hydrogeology, Particle size, Climates, Weather, Surface waters, Groundwater, California, Nevada, New Mexico, Utah, Oregon, Arizona, Groundwater movement, Discharge (Water), Groundwater basins.
Identifiers: *Western U.S.

In order to learn more about the sediments and the geomorphic processes operative on Coyote Playa, California, a rotary drilling and coring program was conducted in 1965 and 1966. Throughout the playa surface, capillary discharge of groundwater occurs from a shallow (10 to 25 foot) extensive zone of subsurface permeability, and capillary discharge combined with hydrostatic head occurs from deeper water-bearing beds below the playa clays. This capillary discharge may have an important influence on the surface morphology. Puffy ground and the wavy undulating surface may be formed wholly or in part from processes associated with groundwater discharge. (See also W71-05073) (Knapp-USGS)

Identifiers: *Western U.S.

Big Smoky Playa is in the southern part of Big Smoky Valley, Nevada. Well-developed shoreline encircle the playa, suggesting that the location of a Pleistocene lake (Lake Tonopah) influenced its size and shape. Surface types on Big Smoky Playa in 1965 ranged from a hard, smooth surface to a soft, puffy one. Several holes were augered beneath the transition surface, in one place to a depth of 20 feet; however, a water-bearing zone was not penetrated. No significant textural difference was found in the sediments underlying the puffy areas and the smooth hard areas. Groundwater discharge from a shallow aquifer controls the formation of puffy ground on Big Smoky Playa. The shallow aquifer consists of complex interfingering of permeable lenses of sand and coarse silt within the less permeable silt and clay. Water under hydrostatic head fills the sand-silt lenses and capillary flow from these lenses produces the puffy ground. (See also W71-05073) (Knapp-USGS)

GEOLOGY AND HYDROLOGY OF TROY PLAYA, SAN BERNARDINO COUNTY, CALIFORNIA,
Texas Univ., Austin. Bureau of Economic Geology.
Charles G. Groat.
In: Geology and Hydrology of Selected Playas in Western United States, Massachusetts University, Geology Department, Final Scientific Report (Part II) to Air Force Cambridge Research Laboratories (AFCRL-69-0214), Chapter 5, p 166-199, May 1970. 34 p, 13 fig.

Descriptors: *Playas, *Sedimentation, Lake basins, Geomorphology, Deserts, Evaporation, Hydrogeology, Particle size, Climates, Weather, Surface waters, Groundwater, California, Nevada, New Mexico, Utah, Oregon, Arizona, Groundwater movement, Discharge (Water), Groundwater basins.
Identifiers: *Western U.S.

Troy Playa is located in the southeast corner of the Lower Mojave Valley, an area formerly occupied by Lake Manix of late Pleistocene age. The upper 10 to 15 feet of playa sediments have two lithofacies: (1) an upper mud facies grading to sandy mud near the playa margins and (2) an underlying sand facies characterized by sand and muddy sand granular coarse sand in the upper few inches. The sand facies probably records fluvial and eolian deposition, whereas most of the mud was deposited in ephemeral playa lakes. Most of Troy Playa has a puffy surface produced by capillary discharge of shallow groundwater. A hard playa surface is present in the southwestern part of the playa where the water table is farther below the surface. Declining groundwater levels have resulted in a decrease in capillary discharge at Troy Playa which could foster a conversion from a puffy to a hard-compacted playa surface. Heavy pumpage and minimal recharge caused a decline in the potentiometric surface. The decline in areas of heavy pumpage west of the playa is resulting in intrusion of poor-quality water from the Troy Playa area into freshwater aquifers west of the playa. RECONNAISSANCE GEOLOGY OF CLAYTON PLAYA, NEVADA,
Shell Oil Co., Midland, Tex.
David B. Matz.
In: Geology and Hydrology of Selected Playas in Western United States, Massachusetts University, Geology Department, Final Scientific Report (Part II) to Air Force Cambridge Research Laboratories (AFCRL-69-0214), Chapter 6, p 214-236, May 1970. 23 p, 12 fig, 7 ref.

Descriptors: *Playas, *Sedimentation, Lake basins, Geomorphology, Deserts, Evaporation, Hydrogeology, Particle size, Climates, Weather, Surface waters, Groundwater, California, Nevada, New Mexico, Utah, Oregon, Arizona, Groundwater movement, Discharge (Water), Groundwater basins.
Identifiers: *Western U.S.

Clayton Valley is the terminal discharging locality for deep water circulation throughout the Tonopah area of Nevada. Logs of closely-spaced test holes show disturbed and chaotic deposits which are characteristic of many terminal groundwater discharging playas. The large amount of groundwater and capillary discharge accompanied by deposition of salts has probably disrupted the bedding and lamination of sediments formed in the playa and playa-lake environment. Also by this process, silty mine tailings have been destroyed in the last 50 years. In some places high mineralization of groundwater is related to the formation of hard and soft irregular puffy ground. Near the center of the playa small areas of knobby-hard ground are formed around the accumulation of twigs, branches and roots carried into the playa by floods. (See also W71-05073) (Knapp-USGS)

SOME HYDROLOGIC AND GEOLOGIC PROCESSES INFLUENCING PLAYA DEVELOPMENT IN THE WESTERN PART OF THE BASIN AND RANGE PROVINCE, UNITED STATES,
Massachusetts Univ., Amherst. Dept. of Geology.
Ward S. Motts.
In: Geology and Hydrology of Selected Playas in Western United States, Massachusetts University, Geology Department, Final Scientific Report (Part II) to Air Force Cambridge Research Laboratories (AFCRL-69-0214), Chapter 7, p 237-286, May 1970. 50 p, 28 fig, 3 tab, 13 ref.

Descriptors: *Playas, *Sedimentation, Lake basins, Geomorphology, Deserts, Evaporation, Hydrogeology, Particle size, Climates, Weather, Surface waters, Groundwater, California, Nevada, New Mexico, Utah, Oregon, Arizona, Groundwater movement, Discharge (Water), Groundwater basins.
Identifiers: *Western U.S.

Surface morphology of most coarse-grained and many fine-grained playas is related to several factors, including the rate of capillary discharge and the frequency of surface-water flooding. Puffy ground is present where the rate of capillarity is relatively high and where relatively few floodings occur. A smooth surface is present where the capil-

lary rate is low or lacking and where a relatively large number of floodings occur. During winter many playas of the Mojave Desert are frequently flooded. Water on the playa shifted and moved in response to changes in wind direction. Silts and clays near the surface became saturated with water, thereby increasing their mobility. Geomorphic features on playas constantly change in response to short-term and long-term climatic fluctuations. Daily and monthly changes in microrelief are commonly caused by playa flooding and by seasonal climatic variations. Sediments deposited in the playas of the Mojave Desert are soon removed by wind erosion. (See also W71-05073) (Knapp-USGS)
W71-05080

MORPHOLOGY OF THE SLIMS RIVER,
New York State Univ. College, Fredonia.
Robert K. Fahnestock.
In: Icefield Ranges Research Project Scientific Results, Volume 1: American Geographical Society (New York) and Arctic Institute of North America (Montreal), p 161-172, 1969. 12 p, 7 fig, 4 tab, 20 ref. NSF Grant GP-2814.

Descriptors: *Channel morphology, *Sediment transport, *Glaciers, *Alluvial channels, Sediment load, Regime, Braiding, Geomorphology.
Identifiers: *Outwash, *Slims River (Canada).

The Alaska Highway crosses the Slims River at mile 1060 where in 1965 the river was building a delta into Kluane Lake. Kaskawulsh Glacier, 14 mi. upstream, was the source of much of the debris being deposited in the valley. The surrounding countryside is covered with loess derived from the valley train. The discharge of the Slims River ranged from 0 to 20,000 cfs. In an upstream zone, 1 to 3 channels were cutting down in coarse gravel on a slope lower than that of the intermediate zone. The river was multichanneled in the intermediate zone with considerable bed load transport and some deposition. At all stages it was channel and bar dominated. About mile 1.5 in the intermediate zone, the slope was 15 ft./mi. and at relatively high flows in July 1965, 30 channels covered nearly half of the 6000-ft.-wide valley floor. In the downstream zone at high stages the river had a few bars and graded into a sheet of flowing water. On sand, at mile 6.2 in the downstream zone, on a slope of 4.5 ft./mi. 20 channels covered nearly all of the 5700-ft.-wide valley floor. The stream was regrading the valley train. In 1967, the Kaskawulsh Glacier's contribution to the Slims River shifted subglacially to the Kaskawulsh River, imposing a new set of conditions on the valley train and Kluane Lake. Initial changes due to this shift include a major decrease in discharge of Slims River and an increase in amount of blowing sediment. (Knapp-USGS)

MINERALOGY OF A PLAYA SOIL AND UNDERLYING SEDIMENTS FROM THE HIGH PLAINS MEDIUM-TEXTURED SOIL ZONE,
Texas Tech. Univ., Lubbock. Dept. of Soil Science.
Kenneth Ray Davis.
M Sc Thesis, Texas Tech University, December 1970. 109 p, 18 fig, 13 tab, 66 ref. OWRR Project B-004-TEX (1).

Descriptors: *Playas, *Sediments, *Soil types, *Texas, Sedimentation, Recharge, Geology, Mineralogy, Clay minerals, Soil classifications, Soil formation, Soil chemistry, Soil investigations, Soil physical properties, Permeability.
Identifiers: *Playa soils.

The primary objectives of this study were (1) to determine the mineralogy of a selected playa soil and its underlying sediments and (2) to determine the relationship of the sediments to the associated upland soils. The selected playa was located on native rangeland in eastern Hockley County, Texas. A soil mapped as Randall clay occupies the floor of the playa which seemed to be typical of the medium-textured soil zone. Appreciable natural recharge of playa water to the aquifer is unlikely because of the high amount of fine expanding clay in the playa soil. (Knapp-USGS)

RADON IN GROUNDWATERS OF DOLOMITIC AND CALCAREOUS AQUIFER IN APULIA (SOUTHERN ITALY),
CNEN, Laboratory for the Application of Radioisotopes to Hydrogeology, Bari, and Bari Univ., Italy.
G. Magri, and G. S. Tazioli.
In: Isotopes Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Engergy Agency STI/PUB/255, Paper No SM-129/53, p 835-845, 1970. 11 p, 6 fig, 12 ref.

Descriptors: *Radioisotopes, *Tracers, *Hydrogeology, *Karst, Aquifers, Limestones, Dolomites, Saline water intrusion, Groundwater movement, Water circulation, Water chemistry, Water wells, Springs, Sampling, Water analysis, On-site tests.
Identifiers: *Radon, *Italy.

The Mesozoic limestones and dolomites forming the basement of the whole of Apulia, Italy are a huge natural groundwater reservoir with fresh water overlying intruding sea water. The radon content of these waters was determined by in-situ measurements of gamma activity of the decay products of radon, which was collected on activated carbon by filtering the water. Measurements were made on water from springs and from drilled and hand-dug wells in areas where the geological conditions are known. Where there are rock levels in which the radioactivity is higher than that normally encountered in the aquifer, the radon provides a natural tracer for following groundwater circulation. The radon contents are studied in relation to the water temperature and salinity, the natural gamma radioactivity of the rocks, carbon dioxide contents, and the filtration rate, using radioactive tracers and the borehole dilution technique. Where the natural radioactivity of the rocks is distributed evenly, a relationship was observed between the mobility of the groundwater and the radon content: in general, the greater the mobility the higher the radon content. In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/54, p 847-868, 1970. 22 p, 5 fig, 5 tab, 26 ref.

Descriptors: *Radioactive dating, *Carbon radioisotopes, *Groundwater, *Hydrogeology, *Surface waters, Precipitation (Atmospheric), Mixing, Groundwater movement, Streamflow, Aquifers, Soil water.
Identifiers: *Silicon radioisotopes, *Groundwater dating.

Extensive studies of cosmogenic Si-32 activity in precipitation surface and sub-surface waters, rain water, and rock/soil systems have established its usefulness for (1) dating groundwater younger than 2000 years and (2) checking the validity of C-14 ages between 2000 and 5000 years. If a concordant age is found based on both Si-32 and C-14 the deduced apparent age (irrespective of the mode used) is in fact close to the 'true age' of the ground water. However, if this is not so, it would be expected that a given water body will look younger on the basis of a shorter-lived radioisotope and that the 'true age' would be even greater than that obtained on the basis of the longer-lived isotope. Such a situation would result from mixing of old and young waters in the aquifer. Intercomparison of Si-32 and C-14 ages is valuable in the delineation of groundwater characteristics. (Knapp-USGS)

GEOCHEMISTRY OF LITHIUM IN THE SEDIMENTARY CYCLE,
Akademiya Nauk SSSR, Moscow. Institut Geokhimii i Analiticheskoi Khimii; and Moscow State Univ. (USSR). Dept. of Geochemistry.
A. B. Ronov, A. A. Migdisov, N. T. Voskresenskaya, and G. A. Korzina.
Translated from Geokhimiya, No 2, p 131-161, 1970. Geochemistry International, Vol 7, No 1, p 75-102, 1970. 28 p, 9 fig, 6 tab, 44 ref.

Descriptors: *Geochemistry, *Sedimentation, *Weathering, *Alkali metals, Distribution patterns, Trace elements, Leaching, Geology, Mineralogy, Sediment transport, Clays, Clay minerals.
Identifiers: *Lithium, USSR.

A large amount of data is surveyed to reveal the pattern of the geochemistry of lithium during weathering and deposition. This survey extends from the Riphean to the Quaternary in the Russian platform. Elution of Li predominates in the initial (alkaline) stage of weathering, while in the later (more acid) stages, the Li accumulates with Al in clay minerals. There are two main types of Li distribution in sedimentation. The first involves proportional deposition with Al in the aluminosilicate structures of clay minerals; it is the commoner during sedimentation and preserves the relations built up in the weathering crust. The second (rarer) type of Li distribution occurs in the sediments of salt lakes, where the Li accumulates along with Mg, SO3, and Cl, which are characteristic of sea water. The Li balance in the crust is discussed, and it is concluded that there is no substantial disturbance in the balance in the outer parts of the Earth. The bulk of the Li is concentrated in rocks of the continental crust. (Knapp-USGS)

rs: Carbonic gradient, Planaria.

This summary of a thesis is concerned with the influence of carbon dioxide on life activity of stream-inhabiting Planariidae: Dugesia gonocephala, D subtentaculata, D tigrina, and Polycellis felina. The well-being of these turbellarian worms is influenced by the dissolved carbon dioxide as much as it is by temperature and water oxygenation. The carbon dioxide is believed to be at the origin of chemotropism and favors the sensory-motor activity, metabolism, growth, sexual maturation, and an increased longevity. (Wilde-Wisconsin)

Identifiers: *Specific conductance-Ionic strength relations, Specific conductance, Ionic strength.

In an aqueous solution each cation-anion combination has its own characteristic curve on a plot, made on a log-log scale, of ionic strength versus conductance. If the major ionic combinations are known for a particular salt solution or natural-water source, ionic strength can be estimated from such a plot of these major cation-anion combinations. If, on the basis of previous periodic analyses, the ionic composition has only dilution as the main variable, then a characteristic plot may be made for that salt solution or natural-water source and used for future estimations of its ionic strength. ANALYSIS OF WATER TEMPERATURE VARIATIONS IN LARGE RIVER,
Illinois State Water Survey, Peoria.
Veerasamy Kothandaraman.
ASCE Proceedings, Journal of the Sanitary Engineering Division, Vol 97, No SA 1, Paper 7908, p 19-31, February 1971. 13 p, 4 fig, 8 tab, 9 ref, append.

Descriptors: *Water temperature, *Fourier analysis, *Streamflow, *Variability, Illinois, Rivers, Seasonal, Statistical methods, Water quality, Cooling water, Thermal powerplants, Weather, Humidity.
Identifiers: Illinois River.

The seasonal variations in daily mean river water temperatures and daily mean dry bulb temperatures are adequately represented by harmonics with a periodicity of 1 year. Harmonics with a frequency higher than 1 cycle per yr contribute very little toward the seasonal variations. In the Illinois River nonseasonal variations in the daily mean water temperatures for any given day can be obtained, as a linear combination of the nonseasonal variations in the daily mean dry bulb temperatures, for that day and the preceding 2 days. (Knapp-USGS)

CARBON DIOXIDE EXCHANGE AT THE AIR-SEA INTERFACE: FLUX AUGMENTATION BY CHEMICAL REACTION,
Illinois Univ., Urbana. Dept. of Chemical Engineering.
J. A. Quinn, and N. C. Otto.
Supported in part by a grant from Office of Saline Water. Journal of Geophysical Research, Vol 76, No 6, p 1539-1549, February 20, 1971. 11 p, 3 fig, 26 ref.

Descriptors: *Carbon dioxide, *Air-water interfaces, *Sea water, *Water chemistry, Ion transport, Diffusion, Mass transfer, Hydrogen ion concentration, Hydration, Dehydration.
Identifiers: Carbon-dioxide flux.

The stagnant film model for the transport of CO2 across the air-sea interface is reexamined. By incorporating the constraint of electroneutrality, equations are derived to describe the flux of the carbon containing species within the film. The assumption of electroneutrality obviates the incorrect assumption of constant pH implicit in previous exchange calculations. Numerical results for typical ocean conditions indicate that for film thicknesses less than about 400 microns, oceanic exchange is not influenced by the hydration/dehydration reactions of dissolved carbon dioxide. However, if suitable catalysts are present in the ocean, the accelerated reactions are capable of augmenting the exchange rate by a considerable amount. The extent of this enhancement can be predicted by the model presented. (Knapp-USGS)

GEOLOGIC SIGNIFICANCE OF THE MINOR-ELEMENT COMPOSITION OF MARINE SALT DEPOSITS,
Geological Survey, La Jolla, Calif.
George W. Moore.
Economic Geology, Vol 66, No 1, p 187-191, January-February 1971. 5 p, 1 fig, 2 tab, 29 ref.

Descriptors: *Water chemistry, *Chemical precipitation, *Salts, *Trace elements, Sodium chloride, Evaporation, Mineralogy, Paleohydrology.
Identifiers: *Evaporites.

Detailed chemical analyses of marine halite rock ranging in age from Cambrian to Holocene are compared. If evaporite deposites reflect the geologic history of sea water, then a similar composition of rock salt of differing ages suggests that the ratio between ions in sea water has remained approximately constant since Cambrian time. Some elements, such as strontium and boron, are depleted in marine halite rock because they are deposited respectively earlier and later in the evaporation sequence. Lead is enriched a thousandfold, possibly because of heavy-metal concentration by microorganisms. (Knapp-USGS)

VAPOR-DOMINATED HYDROTHERMAL SYSTEMS COMPARED WITH HOT-WATER SYSTEMS,
Geological Survey, Menlo Park, Calif.
D. E. White, L. J. P. Muffler, and A. H. Truesdell.
Economic Geology, Vol 66, No 1, p 75-97, January-February 1971. 23 p, 7 fig, 6 tab, 58 ref.

Descriptors: *Geothermal studies, *Thermal water, *Steam, *Water vapor, *Hydrogeology, Groundwater movement, Mass transfer, Ion transport, Heat flow, Water temperature, Geysers, Water levels, Water table.
Identifiers: *Hydrothermal systems.

Vapor-dominated 'dry-steam' geothermal systems are uncommon and poorly understood compared with hot-water systems. Critical physical data on both types were obtained from U.S. Geological Survey research in Yellowstone Park. Vapor-dominated systems require relatively potent heat supplies and low initial permeability. After an early hot-water stage, a system becomes vapor dominated when net discharge starts to exceed recharge. Steam then boils from a declining water

table; most condenses below the surface, where its heat of vaporization can be conducted upward. Liquid water favors small pores and channels because of its high surface tension relative to that of steam. Steam is largely excluded from smaller spaces but greatly dominates the larger channels and discharge from wells. With time, permeability of water-recharge channels, initially low, becomes still lower because of deposition of carbonates and CaSo4. The 'lid' on the system consists in part of argillized rocks and CO2 saturated condensate. Local supply of pore liquid and a great stored heat of solid phases account for the physical characteristics and the high productivity of steam wells. Vapor-dominated systems provide a good mechanism for separating volatile mercury from all other metals of lower volatility. Mercury is likely to be enriched in the vapor of these systems; the zone of condensation that surrounds the uniform reservoir is attractive for precipitating HgS. (Knapp-USGS)

OCEANIC CO2 SYSTEM: AN EVALUATION OF TEN METHODS OF INVESTIGATION,
Oregon State Univ., Corvallis. Dept. of Oceanography.
P. Kilho Park.
Limnology and Oceanography, Vol 14, No 2, p 179-186, March 1969. 8 p, 3 fig, 1 tab, 20 ref. NSF Grant GA-1281; ONR Research Contract Nonr 1286 (10).

Descriptors: *Water chemistry, *Sea water, *Carbon dioxide, *Hydrogen ion concentration, Carbonates, Bicarbonates, Equilibrium, Alkalinity, Chemical potential, Water analysis, Chemical reactions, Geochemistry, Aqueous solutions, Saline water systems.
Identifiers: Sea water chemistry.

By combining two or more of the parameters pH, carbonate alkalinity, total carbon dioxide, and partial pressure of carbon dioxide, six equations can be obtained to express the concentration of carbonic acid that include molecular carbon dioxide, ten equations for bicarbonate ion, and eleven equations for carbonate ion concentrations. When the present-day analytical precision and the normal oceanic variances of the above four parameters are considered, the pH-partial pressure of carbon dioxide combination is the most promising to study the oceanic CO2 system. (Knapp-USGS)

COLORIMETRIC DETERMINATION OF DISSOLVED OXYGEN AT LOW CONCENTRATIONS,
Washington Univ., Seattle. Dept. of Oceanography.
William W. Broenkow, and Joel D. Cline.
Limnology and Oceanography, Vol 14, No 3, p 450-454, May 1969. 5 p, 2 fig, 3 tab, 9 ref.

Descriptors: *Dissolved oxygen analyzers, *Dissolved oxygen, *Laboratory tests, *Water analysis, Chemical analysis, Instrumentation, Chemical reactions, Water chemistry.
Identifiers: *Winkler method, *Dissolved oxygen analysis.

Oxygen concentrations can be determined colorimetrically by measuring the absorption of ultraviolet light by the triiodide ion that is produced when Winkler reagents are added to the sample. Samples are drawn into syringes to eliminate contact with the atmosphere. Reagents similar to those used in the Winkler method are injected into the syringes, and iodine is released in proportion to the dissolved oxygen originally in the sample. (Knapp-USGS)

ifiers: *Santee River Estuary (SC).

chemical and physical characteristics of water e Santee River estuary were studied in relation lal conditions and fresh-water inflow, and the bility of water for use at different locations was rmined as a basis for evaluating some of the ef- of a proposed diversion of water from Lake Moultrie to the Santee River. Under normal conditions, releases of water from Lake Marion to the Santee River estuary are 500 to 600 cfs. On several days during April and May 1969, however, flood releases exceeded 40,000 cfs. A tidal discharge measurement made at mile 5.9 on the North Santee River showed a maximum flow of 18,500 cfs on the ebb tide, and a maximum flow of 18,500 cfs on the flood tide. At mile 7.0 on the South Santee River, a tidal discharge measurement showed a maximum flow of 14,500 cfs on the flood tide; on the ebb tide the maximum flow was estimated to be 15,800 cfs. Under flood conditions in April and May 1969, the Santee River estuary changed from a partially mixed to a highly stratified condition. As flood waters flushed salt water seaward, freshwater was observed below mile 5.0 on both the North and South Santee Rivers. Dissolved oxygen measurements, temperature measurements, and chemical analyses of water indicate that the quality of the water and the variations in quality are due to natural processes; only the occurrence of detergents and pesticides indicate cultural activity. Water of the North and South Santee Rivers at mile 14 and above is of excellent quality for most domestic, industrial, and agricultural uses. (Knapp-USGS)

ON THE SEASONAL DISTRIBUTIONS OF TEMPERATURE AND SALINITY IN RHODE ISLAND SOUND,
Naval Underwater Systems Center, Newport, R.I.
David H. Shonting, and Gerald S. Cook.
Available from NTIS as AD-715 203, $3.00 in paper copy, $0.95 in microfiche. Reprinted from Limnology and Oceanography, Vol 15, No 1, p 100-112, Jan 1970. Rept No NUSC-TD-125, 15 Oct, 1970. 16 p, 9 fig, 1 tab, 11 refs.
Identifiers: *Oceanographic data, Temperature, *Sea water, Salinity, Hydrographic surveying, Thermoclines, Narragansett Bay, Rhode Island, Rhode Island Sound.

The temperature and salinity of Rhode Island Sound were measured between July 1963 and July 1964. A seasonal thermocline developed at mid-depth in spring and intensified through August. Early fall cooling and wind mixing rapidly destroyed the thermocline, rendering the water column practically isothermal by late October. The salinity patterns are more complex than those of temperature and are strongly influenced by seasonal variations in coastal runoff. Brackish water outflow from Narragansett Bay was traced as a salinity wedge as far as 20-30 km from the coast. The seasonal variation in thermal energy of the sound is estimated to be at least four orders of magnitude greater than the potential energy changes.

PARTICULATE ORGANIC MATTER IN KANEOHE BAY, OAHU, HAWAII,
Hawaii Inst. of Geophysics, Honolulu.
Frances Anne Steinhilper.
Available from NTIS as PB-195 806, $3.00 in paper copy, $0.95 in microfiche. Hawaii Institute of Geophysics Report HIG-70-24, Dec 1970. 53 p, 11 fig, 14 tab, 25 ref.
Identifiers: *Sea water, Organic compounds, *Bays Topographic features, Hawaii, *Organic wastes, Sea water, Carbon, Nitrogen, Particles, Carbonates, Sewage, Water analysis, Chlorophylls, Primary biological productivity, Phytoplankton, Theses, Kaneohe Bay, Oahu Island, Carbon budget.

During the 3-month period from March through May 1970, a study of particulate organic matter was undertaken in Kaneohe Bay. The Bay was divided into two basins on the basis of circulation and topography and eight stations along the length of the Bay were sampled at 5-meter intervals. Particulate organic carbon concentrations varied temporally, ranging at the sewer outfall from a high of 686 microgram/l to a low of 121 microgram/l. Concentrations were constant with depth and decreased with increasing distance from the sewer outfall. Particulate nitrogen displayed the same trends as particulate organic carbon, ranging in concentration from 117 microgram/l to 27 microgram/l at the outfall. Total organic carbon concentrations showed similar trends, decreasing from 1.6 to 0.7 microgram C/l, except at Station 2. At Station 2, high surface productivity, probably caused by increased dissolved organic concentrations, resulted in a total organic carbon concentration of 2.6 microgram/l. A carbon budget was calculated for the southern basin. Circulation and primary production were determined to be important factors in the high organic carbon concentrations in the Bay; sewage discharge and runoff were secondary sources. Sewage discharge is indirectly an important source of Bay carbon as the effluent's high nutrient content results in high productivity.

Progress during the first year of a multidisciplinary study of the coastal environment of a section of the Atlantic Sea Coast (Delaware and adjacent New Jersey and Maryland areas) is summarized. Included are field, laboratory, and theoretical investigations of sedimentary processes, coastal vegetation, tidal marsh soils, wave action and attenuation, air-sea interactions, geological history and marine biology. Correlation of ground observations with high altitude photographic imagery to provide a useful method for the remote characterization of such coastal regions is an important objective.

STATUS OF SALT-WATER ENCROACHMENT IN 1969 IN SOUTHERN NASSAU AND SOUTHEASTERN QUEENS COUNTIES, LONG ISLAND, NEW YORK,
Geological Survey, Mineola, N.Y.
Philip Cohen, and G. E. Kimmel.
For sale by Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $3.75. Geological Survey Research 1970, Chapter D, Professional Paper 700-D, p D281-D286, 1970. 6 p, 2 fig, 4 tab, 13 ref.

Descriptors: *Saline water intrusion, *Aquifers, *New York, Withdrawal, Path of pollutants, Water balance, Sea water, Water levels, Hydrogeology, Hydrologic data, Data collections, Monitoring, Water quality.
Identifiers: *Long Island (NY).

Chloride data obtained from 'outpost' wells and other wells in southern Nassau and southeastern Queens Counties, Long Island, N.Y., indicate that landward movement of a deep wedge of salty groundwater in the area has been minimal from 1960 to 1969. Significant changes in chloride content were noted in only 3 of 30 outpost wells. Chloride content of water from a well in southeastern Queens County increased from 34 mg/l in 1960 to 112 mg/l in 1969, as a result of intensive groundwater withdrawals in that county; chloride content in two wells in Nassau County increased from 8,520 to 11,000 mg/l and from 2,000 to 8,110 mg/l during the same period. These increases resulted from local heavy pumping near the zone of diffusion. No increase in chloride content was noted in water from the Lloyd aquifer, except where leaky casings permitted downward flow of salty water. (Knapp-USGS)

WATER MASSES AND GENERAL CIRCULATION OF THE GULF OF MEXICO,
Texas A and M Univ., College Station. Dept. of Oceanography.
Worth D. Nowlin, Jr.
Oceanology, Vol 6, No 2, p 28-33, February, 1971. 6 p, 15 fig.

Descriptors: *Water circulation, *Gulf of Mexico, *Thermal stratification, Currents (Water), Dissolved oxygen, Salinity, Oceanography, Water temperature.
Identifiers: Water masses.

It is possible to distinguish and identify the origins of vertically layered waters within the Gulf: the surface mixed layer, North American deep water, subtropical underwater, oxygen minimum water, Antarctic intermediate water, North American deep water, and the basin waters. A general circulation pattern consists of a clockwise Loop Current flowing from the Yucatan to the Florida Strait in the eastern Gulf, but no strong, semi-permanent currents in the western Gulf. Large current rings, or edies, form from the Loop Current. A well-defined pattern of winter flow contrasts with a highly variable summer pattern for the western Gulf. The flow is influenced greatly by bottom or lateral friction with the shelves and that the deep Gulf waters connect directly with the deep Atlantic water only through the Caribbean Sea. At depths shallower that 1,000 m, inflow to the Gulf is generally through Yucatan Strait; outflow is through the Florida Strait. (Knapp-USGS)

paper copy, $0.95 in microfiche. Report R
Sept 1970. 46 p, 7 fig, 4 tab, 13 ref. DAAB-0
C-0199.
Identifiers: *Desalination, *Distillation, Co
Optimization, Programming, Computers, M
matical models, Salinity, Sea water.

Due to the necessity for chemically pretreatin
saline input flow to a desalination plant, it
vantageous to recycle through the condens
fraction of the brine leaving the plant to reduc
required saline input flow and thereby re
pretreatment costs. Such a system is referred
single effect or multieffect depending

whether it has one or multiple recycle loops each in series configuration. The model for the present analysis is of the single effect type. It is the purpose of the analysis to develop a reliable mathematical model for the process and to present it in a form compatible with optimization via dynamic programming. It is felt that such an approach has the advantage that given a certain demand on the system the designer can optimize his cost performance index without having to fix the number of flashing stages or the amount of product flashed in each stage. To test the model and the optimization of that model a 50 million gallon per day system has been chosen.

3B. Water Yield Improvement

INCREASES IN STREAMFLOW AFTER CONVERTING CHAPARRAL TO GRASS,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
Alden R. Hibbert.
Water Resources Research, Vol 7, No 1, p 71-80, February 1971. 10 p, 8 fig, 1 tab, 8 ref.

Descriptors: *Water yield improvement, *Arizona, *Weed control, *Chaparral, Range management, Trees, Watershed management, Evapotranspiration control, Rainfall-runoff relationships, Arid lands, Rainfall disposition, Water yield, Demonstration watersheds.
Identifiers: *Experimental watersheds.

Water yield has increased substantially on two small chaparral watersheds in central Arizona following brush control and conversion to grass. Winter precipitation is the major source of water yield. Summer rains begin in July and normally account for about one-fourth of the annual precipitation but generally have little effect on streamflow. When annual precipitation is less than 16 inches, increase in water yield resulting from treatment is likely to be less than 2 inches. However, the efficiency of the conversion for producing extra water improves with rainfall, at least up to 34 inches. At this amount of annual precipitation, the increase in flow may reach 12 inches or more, depending on seasonal distribution of the rain. (Knapp-USGS)

PROJECT SKYWATER, PROCEEDINGS: SKYWATER CONFERENCE IV OPTIMIZATION OF OPERATIONAL WEATHER MODIFICATION.
Bureau of Reclamation, Denver, Colo. Office of Atmospheric Water Resources.

Available from NTIS as PB-195 887, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation Report REC-OCE-70-56, May 21-22, 1968. 365 p.

Descriptors: *Weather modification, Precipitation (Atmospheric), Cloud modification, Decision making, *Research and development, Silver iodide, Investigations, *Meteoric water, Water resources, Instrumentation, Water utilization, Progress reports, Orographic clouds, Cloud physics, Cloud seeding, Orographic precipitation, Reviews.
Identifiers: USBR Research Contracts, Skywater Project.

The Bureau of Reclamation's Atmospheric Water Resources Program, called Project Skywater, is developing the capability to apply precipitation management techniques to the solution of our nation's water needs. Evolutionary processes leading toward the best precipitation management system require the identification and analysis of the many problems in weather modification. Optimization of operational weather modification is presented. The objectives of each research contract program and the procedures for meeting these objectives are given. Discussions of the balance between research and operations and the roles of educational, private, and Government institutions in weather modification, in general, and Project Skywater in particular, are summarized. A statistical summary of the opinions returned expressing the status of the present and future state of the art is included.

1968 FLORIDA CUMULUS SEEDING EXPERIMENT: NUMERICAL MODEL RESULTS,
National Oceanic and Atmospheric Administration, Miami, Fla. Experimental Meteorology Lab.
Joanne Simpson, and Victor Wiggert.
Monthly Weather Review, Vol 99, No 2, p 87-118, February 1971. 32 p, 32 fig, 13 tab, 34 ref. Bureau of Reclamation Contract 14-06-W-176.

Descriptors: *Cloud seeding, *Evaluation, *Florida, Mathematical models, Numerical analysis, Water yield improvement, Silver iodide, Statistical methods, Cloud physics, On-site tests, Weather modification.
Identifiers: Cloud seeding evaluation.

A one-dimensional numerical cumulus model was tested against data from a randomized seeding experiment made in South Florida in 1968. Fourteen GO clouds were studied. Nine were seeded by pyrotechnics with 1 kg of silver iodide each, while five were studied identically as controls. Various seeding subroutines and assumptions regarding the ice phase are compared. The experimental aircraft data are used to guide the modeling assumptions and to select the most realistic ones. Seedability and seeding effect correlate to 0.96 for seeded clouds in the three best models. A high correlation is found between seedability and radar-measured rainfall increase from seeding. Also, a high correlation is found between model predictions of the difference in precipitation fallout between seeded and control clouds and the measured rainfall differences, although the model predictions are much smaller in magnitude. A calculation is undertaken showing that coalescence within the cloud body on descent of the raindrops easily accounts for the discrepancy. The model predictions for each GO cloud are discussed in comparison with actual measurements on the cloud. The 1968 experiment was found to subdivide into two periods, one fair and one disturbed with quite different effects of seeding. The two periods and corresponding cloud behavior are compared. It is concluded that the disturbed period was less favorable for seeding because of higher unseeded cloud growth and strong wind shear. Implications of this result for future modeling efforts are discussed. (Knapp-USGS)

EVAPORATION REDUCTION WITH FLOATING GRANULAR MATERIALS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
Lloyd E. Myers, and Gary W. Frasier.
Journal of the Irrigation and Drainage Division, Proceedings of ASCE, Vol 96, No IR4, Proc. Paper 7741, p 425-436, December 1970. 2 fig, 4 tab, 12 ref.

Descriptors: *Reservoir evaporation, *Evaporation control, *Chemcontrol, Water yield improvement, Water supply, Irrigation, Evaporation.
Identifiers: Reflective materials.

Investigations were conducted to determine the feasibility of reducing evaporation from open water surfaces with white, floating granular materials which cool the water by reflecting incoming shortwave radiation. Studies were conducted on buried 7.2-m diameter tanks where almost all energy exchange occurred through the water surface. Materials evaluated were calcium carbonate dust, silica sand, polystyrene beads, chopped styrofoam and perlite. Evaporation reduction for 1 week ranged from 21% for water repellent sand to 64% for chopped styrofoam. Authors conclude that floating granular materials are feasible for reducing evaporation of expensive water from open tanks or small reservoirs with reasonably steep banks. Costs, using presently available materials, will be around $1.00 per 1000 gal. saved. (Oleszkiewicz-Vanderbilt)

COST OF PUMPING IRRIGATION WATER IN ARIZONA: 1891 TO 1967,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
William E. Martin, and Thomas Archer.
Water Resources Research, Vol 7, No 1, p 23-31, February 1971. 9 p, 5 fig, 1 tab, 32 ref.

Descriptors: *Water costs, *Irrigation water, *Pumping, *Arizona, Water sources, Water supply, Water management (Applied), Water distribution (Applied), Water levels, Drawdown, Water table, Aquifers, Alluvium, Data collections.
Identifiers: *Irrigation water cost (Ariz).

The historical record of the cost of pumping groundwater in Arizona is examined. Measures used are the cost per acre-foot per foot of lift, the cost per acre-foot, the water cost per acre for important crops, and the total water cost per farm for representative general crop farms. Costs are presented in actual dollars and dollars adjusted by GNP implicit price deflators. Whereas pumping depths have been rising rapidly, costs per acre-foot per foot of lift have been falling, adjusted costs per acre-foot have been almost constant, and per acre costs and total costs relative to both total costs and total returns have fluctuated throughout the time period examined, sometimes being lower but often being higher than costs at the present time. SOIL AND WATER CONSERVATION NEEDS INVENTORY, COOKE, GRAYSON AND FANNIN COUNTIES, TEXAS.
Texoma Regional Planning Commission, Tex.

Available from NTIS as PB-195 447, $3.00 in paper copy, $0.95 in microfiche. Texoma Regional Planning Commission report, Aug 1970. 47 p. HUD Project Tex P-285.
Identifiers: *Regional planning, *Texas, *Soil conservation, Regional planning, *Water conservation, Inventories, Land use, Watersheds, Forest land, Grasses, Cultivation, Floods, Soils, Irrigated land, Maps, Tables, Data, Cooke County (Tex), Grayson County (Tex), Fannin County (Tex).

The inventory includes basic data that show the kind of soil, slope, erosion and land use characteristics in Cooke, Grayson and Fannin Counties. The land use classifications are separated into cropland, pastureland, rangeland, forest and woodland and 'other'. The acreages needing treatment in the various classification are described and the treatment that is feasible for this particular soil deficiency is outlined. Forest and woodlands needing establishment, improvement, protection or windbreaks are also described. All watersheds are delineated showing the problems with flooding and conservation of water along with project actions required to solve these problems.

IRRIGATION FROM UPSTREAM WATERSHED RETENTION RESERVOIRS IN OKLAHOMA,
Economic Research Service, Washington, D.C.
Gordon R. Sloggett.
Oklahoma Agricultural Experiment Station, Progress Report P-631, April 1970. 19 p, 1 fig, 12 tab, 4 ref

Descriptors: *Reservoir storage, *Watersheds (Basins), *Detention reservoirs, *Irrigation efficiency, *Oklahoma, Water conservation, Water management (Applied), Multiple-purpose reservoirs, Farm management, Investment, Irrigation systems, Irrigation practices, Income analysis, Irrigated land, Flood irrigation, Unit costs, Flood protection, Benefits, Net income, Sprinkler irrigation, Corp production, Surveys, Retention.
Identifiers: *Washita River Basin (Oklahoma), *Upstream reservoirs, Wheel move sprinkler, Skid move sprinkler, Boom irrigation.

Over 1,400 detention reservoirs were constructed in Oklahoma by the Soil Conservation Service since 1948. Farmers may use water stored in the sediment pool portion of reservoirs for irrigation. This study determined the number of farmers irrigating from upstream reservoirs; number, types and amount of investment of reservoirs and irrigation systems; and estimated income changes resulting from such irrigation. In 1969 upstream irrigators were interviewed. Largest concentration of irrigators was in the Washita River Basin from western to south-central Oklahoma. About 5,367 acres were irrigated from 89 reservoirs by 92 farmers in 1969. Irrigation systems included hand move sprinkler, flood, wheel move sprinkler, skid move sprinkler, and boom. Number of systems irrigating total acres and total cost were: 72, 4,087, $338,615; 11,658, $64,490; 4, 125, $29,300; 3, 332, $20,600; 2, 165; and $15,000, respectively. Per-acre irrigated cost varied from $62.05 for skid move sprinkler to $234.40 for wheel move sprinkler. Income increased as an unplanned benefit of flood protection. The average farmer irrigating from upstream detention increased his annual net income by over $1,691. Twelve tables give economic data on detention-reservoir irrigation. (Popkin - Arizona)

SELECTION AND MANAGEMENT OF IRRIGATED PASTURE MIXTURES,
Agricultural Research Service, Denver, Colo, and Montana Agricultural Experiment Station, Bozeman. Huntley Branch; and Montana Agricultural Experiment Station, Bozeman. Northwestern Branch.
C. S. Cooper, D. E. Baldridge, and C. W. Roath.
Montana Agricultural Experiment Station, Bulletin 622, February 1969. 22 p, 5 fig, 10 tab, 14 ref.

Descriptors: *Pasture management, *Forage mixtures, *Water management (Applied), *Water conservation, *Planning, Grasses, Legumes, Montana, Livestock, Planting management, Irrigated lands, Soil-water-plant relationships, Pastures, Grazing, Limiting factors, Farm management, Crop production, Labor, Unit costs, Evaluation, Economic prediction, Growth rates, Water demand, Varieties.
Identifiers: Weight gains.

There are an estimated 5 million acres of irrigated pasture in the western U.S., 10 percent of which occurs in Montana and is a major forage source for livestock. Irrigated pasture-mixture management is complex because multiple species have different and competing growth requirements. A discussion of management principles and description of major species and mixture factors are presented. Kentucky bluegrass, orchardgrass, smooth bromegrass and tall fescue are common on irrigated, well-drained soils. Six legumes--white clover, red clover, birdsfoot trefoil, alfalfa, alsike clover, and strawberry clover are recommended for irrigated pasture. Soil-water-plant relationships are discussed. Important considerations are: (1) more animals can be grazed than on range per unit land; (2) irrigated pasture produces good weight gains; (3) irrigated pastures on ranches with limited range may permit a better forage; (4) farm-management programs must be geared to forage as it is produced; (5) grass and legume mixtures yield highest production; (6) irrigated-pasture labor requirements are higher per cow than on range; (7) irrigated-pasture forage costs more per unit than range forage. Irrigated pastures are highly productive and may permit a profitable enterprise. Figures and tables show production and economic data forage species and combinations. There are references. (Popkin-Arizona)

AN ECONOMIC APPRAISAL OF DEVELOPIN THE HARDIN UNIT FOR IRRIGATION,
Montana State Univ., Bozenes. Dept. of Agric tural Economics.
Ralph E. Ward, and Clarence W. Jensen.
Montana Agricultural Experiment Station, Bulle 639, March 1970. 34 p, 4 fig, 10 tab, 18 ref.

Descriptors: *Comparative productivity, A praisals, *Benefits, *Land management, *La development, Irrigation programs, Properti Capital costs, Drainage engineering, Irrigati systems, Water management (Applied), Soc values, Indirect benefits, Grazing, Dry farmir Economic prediction, Economic impact, Econom efficiency, Montana.
Identifiers: *Hardin irrigation unit, *Crow Indi Reservation, *Missouri River Basin Proje Ownership, Trustland, Semiarid lands.

The Hardin irrigation unit, proposed by the Bure of Reclamation for use on the Crow Indian Rese vation, Montana, is evaluated. The unit wou make the land part of the Missouri River Basin Pr ject. The value of irrigated agriculture would about 4 times the amount now obtained by drylar and grazing. There would be substantial indire benefits from increased business activity, emplo ment opportunities, processing plants, and soci benefits such as stabilization, reduced unemplo ment, more facilities for education, transportati and electricity. Local industrial developme would be supplemented. Proposed farm uni would cut across ownership, trust and fee bound ries to create ownership and trustland problem Predevelopment requires land leveling, layouts c irrigation systems, fields and drainage because Ind an landowners cannot make capital improvement Several land control and management plans a proposed: (1) form a non-profit leasing organiz tion for development and maintain present owne ship; (2) change ownership to conform to irrigate farm units; (3) develop leasing and private co porations for development and management. Ar of these plans require a high degree of cooperatio A special educational and promotional progra emphasizing benefits and requiring local sponso ship with technical assistance is necessary. (Popki - Arizona)

CONSUMPTIVE IRRIGATION REQUIRE MENTS FOR CROPS IN IDAHO,
Idaho Univ., Moscow. Dept. of Agricultural En gineering; and Idaho Water Resource Board.
R. J. Sutter, and G. L. Corey.
Idaho Agricultural Experiment Station, Bulleti 516, July 1970. 97 p, 91 tab, 2 fig, 10 ref.

Descriptors: *Consumptive use, *Optimizatio *Planning, *Decision making, *Farm managemen Microclimatology, Water balance, Diversion, Cro production, Irrigation practices, Labor, Inter-basi transfers, Reservoirs, Irrigable land, Idaho, Wate requirements.
Identifiers: *Blaney-Criddle formula, *Crop quali ty, Micrometeorology, Climatic factor, Empiric methods, Evaporimeter, Semiarid lands.

Estimates of irrigation requirements for Idaho's 2. million acres of highly suitable irrigable land ar made for optimal planning projects, reservoir deci sions, interbasin transfer, efficient use, and deter mination of irrigation method, design, schedule cropping pattern, labor requirements, and farm ef ficiencies. Overirrigation is wasteful, and ma decrease yields and lower crop quality. Irrigatio requirements will establish reasonable diversio quotas under legal dispute. Estimates of consump tive use can be made by using water balance micrometeorological, evaporimeter, and empirica methods. These approaches are evaluated. Th

dified Blaney-Criddle formula assumes: (1) con-
ptive use is proportional to the climatic factor;
crops are not limited by inadequate water
ply during the growing season; (3) factors other
n temperature, percentage of daylight hours,
growing season are similar at all locations. Cli-
tological and growing-season data from 42
ather Bureau stations are calculated. Average
ual consumptive and irrigation requirement for
crops for these 42 stations are presented.
ety-one tables show irrigation efficiencies, peak
, and probability data on consumptive irriga-
requirements. (Popkin - Arizona)

modification of a flood wave due to bank age effects can be calculated by using numeri-methods. The dynamic equations describing dimensional open channel flow and the equa- for two-dimensional transient groundwater are solved simultaneously, coupled by an ex-sion for flow through the wetted perimeter of channel. Numerical experiments indicate that d waves may be modified considerably by bank ge, particularly in the lower segments of a long h, and that the degree of modification is in-ced markedly by the hydraulic conductivity of quifer. of monthly streamflow records is generated analyzed to give a set of synthetic critical ds. Some characteristics of these periods are ed, and the mean and standard deviation of values are compared with the appropriate s for the historical critical period. This procedure is repeated with three characteristics for a number of different rivers by using a variety of generating techniques. A study of the results allows a comparison between the generating techniques in regard to both their cost in computer time and their ability to synthesize critical droughts comparable to those recorded historically. The results appear to be influenced by the relative aridity of the watershed and by the size of the reservoir considered. In addition, some general conclusions can be drawn regarding the advisability of using generated streamflow in studies of reservoir design and operation. (Knapp-USGS)

A NEW METHOD OF DETECTING LEAKS IN RESERVOIRS OR CANALS USING LABELLED BITUMEN EMULSIONS (FRENCH),
CEA, Center of Nuclear Study of Grenoble, and Societe routiere Colas, Paris, France.
J. Molinari, J. Guizerix, and R. Chambard.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/47, p 743-760, 1970. 18 p, 11 fig, 6 ref.

Descriptors: *Tracers, *Reservoir leakage, *Canal seepage, *Tagging, *Emulsions, Groundwater movement, Soil water movement, Iodine radioisotopes, Bituminous materials, Seepage, Infiltration.
Identifiers: Leakage detection.

A method of detecting and localizing leaks in natural or artificial stored-water bodies such as lakes, canals, basins, reservoirs, or wells consists of injecting into the stored water an emulsion labelled with a radioactive tracer. The labelled emulsion is entrained into the leakage areas where emulsion particles separate from the water and accumulate. The distribution of these particles, which are proportional to the specific infiltration flow for structures with interstitial permeability, is then determined simply by measuring the radioactivity. Where the labelled emulsion is an emulsion of bitumen, the plastic properties of this product are useful in promoting the agglomeration of the particles and their adhersion to the materials of the revetment or wall to be studied. The preparation of an emulsion of bitumen labelled with iodine-131 and its application in determining permeability gradients and detecting leaks in canal revetments are described. This method has a large range of applications. It can, for example, be successfully used to study the relative permeabilities of strata in which wells, pits or boreholes have been drilled, and to distinguish between areas of varying permeabilities. (Knapp-USGS)

METHOD OF DETERMINING LEAKAGE VELOCITIES THROUGH THE BOTTOM OF RESERVOIRS,
Institute of Nuclear Physics, Cracow, Poland.
A. Zuber.
Supported by International Atomic Energy Agency. In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM 129/48, p761-771, 1970. 11 p, 7 fig, 11 ref.

Descriptors: *Reservoir leakage, *Tracers, Tracking techniques, Flow, Pipe flow, Porous media, Groundwater movement, Instrumentation, Velocity, Seepage, Percolation.
Identifiers: *Reservoir leakage gage.

If a chosen area leaking in a reservoir bottom is tightly covered by a cylindrical cover with an outlet through a pipe, then the product of leakage velocity and the area covered is equal to the product of flow velocity in the pipe and the pipe cross-section. Even extremely low leakage velocities render measurable velocities in the pipe if its cross-section is very small in comparison with the covered area. This idea can be used for leakage velocity measurements if the measuring device does not disturb natural flow lines. Conditions under which this requirement is satisfied are considered in detail. A measuring device constructed according to these conditions and described in the paper can measure leakage velocities from 0.0000005 to 0.003 cm/sec. The flow velocity in the measuring pipe is known from the transit time measurement of an injected pulse of a radioisotope. (Knapp-USGS)
W71-04880

FLOOD ROUTING THROUGH STORM DRAINS: PART I. SOLUTION OF PROBLEMS OF UNSTEADY FREE SURFACE FLOW IN STORM DRAINS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
V. Yevjevich, and A. H. Barnes.
Supported by Bureau of Public Roads and Public Health Service.Colorado State University Hydrology Paper No 43, November 1970. 107 p, 44 fig, 36 tab, 23 ref, 5 append.

Descriptors: *Routing, *Flood routing, *Storm drains, *Unsteady flow, Mathematical models, Computer programs, Hydraulic models, Waves (Water), Critical flow, Supercritical flow, Discharge (Water), Flow, Runoff, Storm runoff.
Identifiers: Storm drain flow routing.

Flood routing through storm drains was studied in a 3-ft diameter, 822-ft long storm conduit and theoretically in terms of the unsteady free-surface flow. Numerical integrations of differential equations by the specified interval scheme, the diffusing scheme, and the Lax-Wendroff scheme are discussed. The method of characteristics is selected for the practical integration procedure whenever the complete differential equations are used. Experimental and analytical investigations of the geometric and hydraulic parameters that define the coefficients of the two differential equations are summarized. The initial and boundary conditions are expressed mathematically for the numerical solutions. The analytically computed waves are then compared with the experimentally observed waves by using the same initial and boundary conditions. Qualitative and quantitative comparisons are given for depth hydrographs at different positions, for depth wave profiles at different instants in time, and for the peak-depth versus both position and time. From a practical point of view, good agreement is indicated by these comparisons. The errors in conduit geometric parameters, in hydraulic parameters, in numerical computations, and in experimental observations are analyzed and discussed. A bibliography of 145 entries is included in Appendix 2. (See also W71-04891 and W71-94892) (Knapp-USGS)
W71-04890

FLOOD ROUTING THROUGH STORM DRAINS: PART II. PHYSICAL FACILITIES AND EXPERIMENTS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
V. Yevjevich, and A. H. Barnes.

Colorado State University Hydrology Paper No 44, November 1970. 43 p, 49 fig, 13 tab, 13 ref.

Descriptors: *Flood routing, *Storm drains, *Hydraulic models, *Colorado, Routing, Unsteady flow, Laboratory tests, Waves (Water), Instrumentation, Calibrations, Computer programs.
Identifiers: Storm drain flow routing.

Experimental storm drain routing research facilities and experiments are described. Design and construction of the experimental storm drain system, instrumentation and calibration, the data recording system, various experimental test conditions and their typical results, and experimental errors are discussed. A large conduit, 3 feet in diameter and 822 feet long, was constructed in the Outdoor Laboratory of Colorado State University to accurately measure geometric and hydraulic characteristics, and the propagating of flood waves. The calibration of the instruments has been carried out to the point where there are relatively small errors. The data recording system was designed and constructed so that the output could be put either on cards or paper tapes and provide a direct input for computations on a digital computer. (See also W71-04890) (Knapp-USGS)
W71-04891

FLOOD ROUTING THROUGH STORM DRAINS: PART III. EVALUATION OF GEOMETRIC AND HYDRAULIC PARAMETERS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
V. Yevjevich, and A. H. Barnes.
Colorado State University Hydrology Paper No 45, November 1970. 37 p, 24 fig, 12 tab, 10 ref.

Descriptors: *Flood routing, *Storm drains, *Hydraulic models, Hydraulics, Unsteady flow, Non-uniform flow, Channel morphology, Flow resistance, Hydraulic design, Shear drag, Roughness (Hydraulic).
Identifiers: Storm drain flow routing.

Results are given of investigation of the geometric and hydraulic parameters of an experimental storm drain routing facility. The errors in cross section geometric parameters are analyzed in a conduit not ideally circular but approximated by an elliptical shape; errors are also analyzed when the undulations in the longitudinal slope of the conduit affect the predicted water surface profiles and thus the geometric parameters for a given water depth. The variation of hydraulic parameter of resistance, expressed by the Darcy-Weisbach friction factor, is experimentally determined and compared to the theoretical relation to Reynolds number. Energy losses in a 90 deg junction box are studied. The velocity distribution coefficients are shown to vary with the Darcy-Weisbach friction factor, and consequently, with the depth of flow. Boundary conditions for both controlled and free outfall are experimentally determined and approximated by power functions. Two types of steady non-uniform flow profiles were observed and analyzed as the initial conditions for the unsteady flow computations. (See also W71-04890) (Knapp-USGS)
W71-04892

FLOOD HAZARD INFORMATION, ROSE CANYON AND SAN CLEMENTE CANYON, CITY OF SAN DIEGO, CALIFORNIA.
Corps of Engineers, Los Angeles, Calif.

Corps of Engineers Flood Plain Report, July 1970. 14 p, 3 fig, 15 plate, 4 tab.

Descriptors: *Floods, *Flood damage, *Flood plains, *California, Regional flood, Flood forecasting, Flood control, Statistical methods.
Identifiers: *San Diego (Calif), Standard project flood, Intermediate regional flood.

Flooding along Rose Canyon from its confluence with San Clementa Canyon to a point about 6 mi upstream in San Diego, California, is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections, and text material relating to the extent of flooding which might occur, based on available records of rainfall, runoff, historical flood heights, and other technical data. No records of past floods are available, but large floods could occur in Rose Canyon. Peak discharge of the Intermediate Regional Flood is estimated at 6,200 cfs 3.4 mi above the mouth of Rose Canyon. The Standard Project Flood peak discharge is estimated at 8,900 cfs. (Woodard-USGS)
W71-04904

FLOOD PLAIN INFORMATION, HATCHIE RIVER, PLEASANT RUN CREEK AND SPRING CREEK, BOLIVAR, TENNESSEE.
Corps of Engineers, Memphis, Tenn.

Prepared for the city of Bolivar. Corps of Engineers Flood Plain Report, August 1970. 39 p, 8 fig, 19 plate, 6 tab.

Descriptors: *Floods, *Flood damage, *Flood plains, *Tennessee, Historic flood, Flood forecasting, Regional flood, Overflow, Design flood, River basin development, Land use.
Identifiers: *Hatchie River, Bolivar (Tenn), Intermediate regional flood, Standard project flood.

A summary of the flood situation at Bolivar, Tenn. is described to aid in solving local flood problems and for planning the best utilization of flood-prone lands. Situated on the left bank of Hatchie River between Pleasant Run and Spring Creek, Bolivar's principal residential and commercial developments are on ground outside the flood plains of the river and Spring Creek, but large portions of land potentially developable have been inundated and this study shows that even greater portions are subject to flooding in the future. Maps, profiles, cross sections, and descriptive material relating past flooding to potential flooding are based on available records of rainfall, runoff, historical flood heights, and other technical data. Records from U.S. Geological Survey stream gaging stations on Hatchie River at State Highway 18, beginning in 1929, and on Pleasant Run at the old U. S. 64 bridge, from 1954, are the basis for much of this report. The greatest flood known on the Hatchie occurred in February 1948; other great floods occurred in Janurary 1946 (second in size), and in January 1935. Winter and spring are the main flood seasons. The Hatchie River flood of 1948 rose to its crest stage in 14 days and was out of banks for 78 days. (Lang-USGS)
W71-04905

PROGRESS REPORT ON AQUATIC WEED CONTROL STUDIES,
Bureau of Reclamation, Denver, Colo. Office of Chief Engineer.
Otto E. Naman.
Available from NTIS as PB-195 774, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation Report REC-OCE-70-26, July 1970. 35 p, 5 fig, 8 tab, 9 ref.

Descriptors: *Aquatic weeds, Dispersing agents, *Herbicides, Aromatic solvents, Water analysis, Irrigation systems, *Weed control, Irrigation canals, Soil treatment, Limnology, Aquatic life, Ecology, *Aquatic weed control, Pondweeds, Phytotoxicity.
Identifiers: Carter Lake, Colo, Xylene, Product evaluation, Progress reports, Aquatic weed study facility.

Laboratory and preliminary field studies on submersed aquatic weed control methods are reported. Several experimental compounds and combinations of herbicides were evaluated for herbicidal activity in greenhouse tests. Only one material was active when applied to the aquatic soil. One new experimental herbicide, formulated allylidene diacetate, showed promise for controlling aquatic weeds in irrigation canals when applied to the total water volume. This material also active when combined with nonphyto levels of xylene. The ammonia ion was activ aquatic weeds in static water, but less effecti flowing water. Seven experimental herbicide t ments were evaluated for activity on pondwee the Carter Lake Aquatic Weed Test Station. lidene diacetate was the most promising and suggested for field testing in an operating irrig canal. Data are presented on studies for deter ing the effects of mineral nutrients on the pro tivity of 2 pondweeds. Preliminary results su that mineral enrichment of water has little d influence on pondweed productivity.

SURFACE WATER CONTROL IN NEW J SEY, DRAINAGE, FLOOD CONTROL AND LATED POLICIES IN AN URBAN STATE,
Rutgers-The State Univ., New Brunswick, N.J reau of Government Research.
Stephen A. Decter.
August 1967, Part I. 125 p, 137 ref.

Descriptors: *New Jersey, *Legislation, *Sur waters, *Water control, State governments, face runoff, Repulsion (Legal aspects), Ridd (Legal aspects), Judicial decisions, Legal asp Administrative agencies, Erosion, Storm ru Floowater, Flood control, Water law, Natural doctrine, Drainage, Drainage systems, Drai water, Surface-groundwater relationships, C Drainage programs, Urbanization, Water policy

Part I of a two-part report submitted by the Jersey Bureau of Government Research, this s of surface water control in New Jersey is div into three chapters: (1) framework for a water icy; (2) laws of water control; and (3) admini tion of water resources. In chapter one, basic p goals--including environmental, developme and governmental goals--problems in achie these goals, and the difficulty in determining public interest are discussed. Chapter two amines: (1) elements of water control; (2) inve ry of water control functions; (3) the cons tional-common-law framework of water con (4) authority to begin operations under statu laws of water control, including disposal and trol of surface water during ordinary wea disposal of storm surface water, control of fl waters, and acquisition of lands and waters; and collection and development of data under statu laws of water control. The criteria for appra administrative adequacy, examination of gov ment levels--including municipal, county and s levels--and inter-level coordination are discusse chapter three. OOD PLAIN INFORMATION OF RAPHANNOCK RIVER, FREDERICKSBURG, OTSYLVANIA AND STAFFORD COUNTIES, RGINIA.
rps of Engineers, Norfolk, Va.

rps of Engineers Flood Plain Report, September 70. 53 p, 11 fig, 12 plate, 11 tab.

scriptors: *Floods, *Flood plains, *Flood protion, *Virginia, Historic flood, Flood forecast, Dams, Land use, Planning, Flood damage.
ntifiers: *Rappahannock River, Intermediate gional Floods, Standard Project Flood.

is report describes flood situations along the ppahannock River in two significant phases--torical floods and probable future floods. Its purse is to help define local flood problems and how best utilize land subject to overflow. The report based on rainfall and runoff data, historical and rent flood heights, and other technical data ilable for the river basin. Maps, profiles, cross tions, and photographs are used to show the ext of past flooding and of probable future floods. e Rappahannock rises in the Blue Ridge Mountns in northern Virginia and flows southeasterly Fredericksburg where it becomes a tidal stream the next 100 mi and discharges into Chesapeake y. This report gives details for the flood plain ch from Muddy Creek upstream to Embrey m above Fredericksburg. The greatest flood of ord occurred in October 1942. The second atest was in April 1937, and was only 1 ft below 1942 flood at the USGS gaging station. Other ge floods occurred in June 1889, May 1901, y 1924, October 1924, and August 1955 (the highest). During the record 1942 flood the er had a maximum rate of rise of 3 ft per hr and ained above the 18-ft flood stage for 48 hr at edericksburg. (Lang-USGS)

OOD PLAIN INFORMATION OF TOBESOFKEE CREEK, MACON AND BIBB COUNTY, ORGIA.
rps of Engineers, Savannah, Ga.

rps of Engineers Flood Plain Report, June 1970. p, 18 fig, 49 plate, 14 tab.

scriptors: *Floods, *Flood plains, Flood nage, *Georgia, Regional flood, Historic flood, od forecasting, Design flood.
ntifiers: *Tobesofkee Creek (Bibb County,).

oding along Tobsofkee Creek near Macon, orgia, is described to aid in solving local flood blems and in planning the best utilization of od-prone lands. Maps, profiles, cross sections, l text material relating the extent of past floods to floods which might occur in the future are ed on available records of rainfall, runoff, torical flood heights and other technical data. cords from U. S. Geological Survey stream gag stations were used to determine flooding, inding that caused by backwater from Ocumulgee er. The greatest flood known on this creek ocred in September, 1929, and other large floods curred in December 1941, March 1944, cember 1964. The analysis indicates that interdiate regional floods (100 year avg occurrence) uld be about 3 ft higher than the March 1944 od. Duration of floods is short, stages can rise m stream bed to extremes peaks in less than 12 after intensive rainfall. Hazardous conditions cur during large floods as a result of rapid rise of ter, high velocities, and deep flows. (Woodard-GS)

ANALYSIS OF RESERVOIR YIELD,
Missouri Univ., Columbia. Dept. of Civil Engineering.
Allen T. Hjelmfelt, Jr.
Water and Sewage Works, 1970 Reference Number, Vol 117, p R14-R15, November 28, 1970. 2 p, 3 fig, 5 ref.

Descriptors: *Reservoir yield, *Mathematical models, *Equations, *Hydrology, *Statistical methods, Analytical techniques, Water supply, Planning, Water resources, Probability, Forecasting, Reservoirs.
Identifiers: Projections.

A probabilistic method for determining the expected yield of reservoirs is described. The aim of the analysis is to establish the probability of not being able to meet the demand. The results of the computations are shown. The probability of the reservoir ending a cycle at a given level or less is graphed against time. The lines are drawn only to indicate trends; they do not indicate a continual process during the year. As time progresses the lines approach the horizontal. That indicates that the distribution is stationary. The analytical method described is easy to use and results in a more meaningful solution than do the more simple mass diagram approaches. For practical application the reservoir would have to be divided into many more levels, resulting in a larger system of equations to be solved. (Woodard-USGS)

Identifiers: *Statistical hydrology, *Flood frequency, Parameters runoff, Storm vs runoff characteristics, Small watershed runoff estimates, Urbana (Ill), Urban hydrology, *Urban drainage, Boneyard Creek (Ill).

Because of the rapid urban development in recent years, hydrologic problems associated with urban watersheds have gained importance. Large sums of money are being spent for the design of urban drainage systems based upon inadequate procedures for predicting peak runoff rates. A procedure is proposed for predicting peak runoff rates from small urban and rural watersheds based upon measurable storm and watershed characteristics. The technique was tested for a number of runoff events on the Boneyard Creek watershed at Urbana, Illinois, and the results of this test are included. The procedure will be particularly useful for estimating runoff rates from small ungaged drainage areas, and thus will be directly applicable to both design and water management problems.

PROBLEMS IN DEVELOPING A NATIONAL FLOOD-PROTECTION POLICY,
American Water Works Association, New York.
Gordon F. White.
In: Water, Health, and Society, Bloomington, Indiana University Press, 1969, p 148-159.

Descriptors: *Flood control, *Water resources development, *Water uses, Engineering, Hydrology, Social aspects, Economic evaluation, Hydrology, Forests, Soil conservation, Dams, Cost-benefit analysis, Water supply, Reservoirs, Irrigation, Navigation.
Identifiers: *Muskingum River, *Multiple use development.

The shortcomings in national flood protection measures are discussed in order to clarify the problems involved in developing a national flood protection policy. Considerable damage is caused by incomplete engineering studies of past destructive floods. The author calls for an accurate assessment of local and national needs in order to provide a more accurate cost-benefit analysis. There is a need for detailed programs of flood protection that meet the social and economic needs of all water uses. The author cites the interrelationship between a National Flood Protection Policy and a general National Water Resources Policy. The elements of such a policy are proposed to run the gamut of engineering, finance, administration, politics, and economics. The ultimate goal of such

national policy would be a basic Water Resources policy, changing in character, logical in administration and geared to the needs of the consumer. Government and private agencies callaberation on various studies to bring this about are surveyed in light of their proposed contribution to eventual successful policy-making. (Murphy-Rutgers)

IRRIGATION WATER REQUIREMENTS FOR CROP PRODUCTION IN THE ROSWELL ARTESIAN BASIN,
New Mexico State Univ., University Park. Dept. of Agricultural Economics and Agricultural Business.
Robert R. Lansford.
In: Proceedings Fifteenth Annual Water Conference, March 12-13, 1970, New Mexico State University Water Resources Research Institute, Las Cruces, p 79-91, 1970. 13 p, 4 fig, 2 tab. OWRR Project A-999-N Mex (5).

Descriptors: *Irrigation water, *Water requirements, *Groundwater, *Crop production, *New Mexico. Artesian wells, Water rights, Irrigated land, Legal aspects, Water law, Economic import, Crop response, Model studies, Mathematical models, Linear programming, Cost-benefit analysis, Economics.
Identifiers: *Roswell Artesian Basin (New Mexico).

In 1966 judgment and decree defined water rights in the Roswell Artesian Basin, New Mexico. The duty of water for irrigated agriculture was established at three acre-feet per acre per annum, only to be exceeded in any one year provided that the total amount diverted during any period of five consecutive years shall not exceed five times the annual duty of water. A study was initiated to assemble and analyze existing cropping patterns, water use, water quality, soil quality, crop yields, and income effects from the judgment and decree. This paper is concerned with the economic or income aspects. The data for the analysis was derived from information obtained on 12 case study farms for the calendar years 1966, 1967 and 1968. Linear programming was chosen as an analytical tool for the economic analysis. The primary purpose was to determine the effect of different quantities of irrigation water on net farm returns. A typical farm budget was developed to compare with results of linear programming to determine the economic effect of restricting the diversion of irrigation water at seven different levels. The average net farm return was $91.35 per water-right acre. (See also W71-05065) (Woodard-USGS)

OBJECTIVES OF A CURRENT STUDY SALINE GROUNDWATER IN THE TULA BASIN, NEW MEXICO,
Geological Survey, Albuquerque, N. Mex.
J. S. McLean.
In: Proceedings Fifteenth Annual Water ference, March 12-13, 1970, New Mexico University Water Resources Research Inst Las Cruces, p 95-100, 1970. 6 p, 3 fig. OWRR ject A-999 N Mex (5).

Descriptors: *Groundwater, *Saline water, * quality, *Saline water systems, *New M Water resources, Fresh water, Water utiliz Consumptive use, Aquifers, Water wells, yield, Irrigation water, Domestic water, water, Municipal water.
Identifiers: *Tularosa Basin (New Mexico).

This study of the saline-water resources of th larosa Basin, New Mexico, delineates the and volume of saline-water zones of spe ranges in concentration; determines the yie present wells; and estimates the potential yie future wells completed in the saline-water z Fresh water was defined as water containin than 1 gram per liter of dissolved solids. Two water lenses occur in the alluvial fill adjacent mountains of the east and west sides o southern part of the basin. The water in the al fill increases in salinity with depth below fresh-water lenses. Salinity also increases to the center of the basin where water three tim saline as sea water has been found. Ground containing 1 to 3 grams per liter of dissolved is used for municipal, domestic, stock, and i tion supply. Only a few stock wells use water taining 3 to 10 grams per liter of dissolved s Groundwater containing more than 35 gra dissolved solids per liter (about the salinity o water) may be present in over 90% of the al fill in the basin. Wells in the basin yield from gallons per minute to 1,400 gallons per mi (See also W71-05065) (Woodard-USGS)

J. U. Anderson.
In: Proceedings Fifteenth Annual Water ference, March 12-13, 1970, New Mexico University Water Resources Research Insti Las Cruces, p 104-106, 1970. 3 p, 1 tab, 1 OWRR Project A-999 N Mex (5).

Descriptors: *Irrigable land, *Land classifica *Irrigation, *New Mexico, Land developm Soils, Soil properties, Soil moisture, Reten Salinity, Soil density, Permeability, Porosity, structure, Drainage, Soil types, Soil water m ment, Topography, Soil-water-plant relationshi
Identifiers: *Irrigability classification.

A proposed new classification system establi four classes of irrigable land and one class of irrigable land in New Mexico. Class 1 land has or no limitations for irrigation; class 4 land has severe limitations; class 6 land is non-irrigable. criteria used to determine irrigation land class tabulated. The suitability of New Mexico lands irrigation is highly variable. In the counties w have been studied in eastern New Mexico, amount of class 1 land varies from 61.5% in C County to 1% in Lea County, and the total irrig land varies from 94% in Curry to 34% in E County. In southwestern New Mexico Luna Co has 13% class 1 and 64% total irrigable land Hidalgo the comparable figures are 10 and 4 The factors that most frequently limit the suitab of New Mexico soils for irrigation are insuffic available water holding capacity, and insuffic effective soil depth. However, the results do s extensive areas which are in classes 1 and 2, are thus very well suited to irrigation. (See W71-05065) (Woodard-USGS)

OFT WATER SUPPLY FOR URBAN CON-
MPTION, A FEASIBILITY STUDY,
ater Planning for Israel Ltd., Tel-Aviv.
Dalinky.
: The Proceedings of the Jerusalem International
nference on Water Quality and Pollution
search, p 79-87, June 1969.

scriptors: *Groundwater, Economic feasibility,
recasting, Cost-benefit analysis, Aquifer.
ntifiers: *Soft-water supply, Hard-water, Public
penditures.

unicipal water supply in Israel is based mainly on
undwater sources that have a high degree of
rdness because of the chemical composition of
aquifers. The author first considers the in-
ence of water hardness on the consumption of
ps and detergents and finds direct relationships
st. Furthermore, water hardness is related to
ater wear of clothing. An economic analysis of
savings or benefits due to the use of a soft water
ply is made. The largest savings are found in the
duction of salt expenditures for ion-exchange sof-
ing plants that are used in hospitals and indus-
. Savings are also found in the reduction of
thes wear-and-tear and in soap consumption.
e analysis does not consider the costs associated
h the use of soft water; namely, the problems
sing from internal corrosion of unlined pipes
ich is necessary for a cost-benefit analysis of the
sibility of soft water supply. This article is rele-
nt to studies of this same problem in the United
tes. (Siegenthaler-Rutgers)

uifers, Resource allocation, Discount rate, In-
st rate, Depreciation, Economic efficiency.
ntifiers: *User cost, Lagrangian multiplier, Sen-
vity analysis.

analytical model is presented which results in
imum decision rules for the conjunctive
nagement of a reservoir and an aquifer in arid
ons. First, the decision environment for water
urce management in arid environs is
eloped. The model focuses on several interre-
d questions associated with maximizing a
efit function based on agriculture production
given stocks of water and expected water
eipts, namely, the optimum pattern of land use
production, the optimum intertemporal alloca-
of water and the optimum rate of investment in
ital for water distribution. Extraction of water
n the reservoir and aquifer is found at the point
re the value of current groundwater in present
e terms is equal to the marginal expected value
he groundwater stock. The marginal storage
e of the reservoir stock is discounted by a
tal survival factor to arrive at benefits net of
reciation effects. The optimum rate of invest-
t at each land group is found where the ex-
ed marginal costs of investment equal the mar-
l expected value of investment discounted by
rest rates and depreciation. (Siegenthaler-Rut-

4C. Effects on Water of Man's Non-Water Activities

STORM RUNOFF RESPONSE FROM ROAD-BUILDING AND LOGGING ON SMALL WATERSHEDS IN THE OREGON COAST RANGE,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
Frederic Shu-kong Hsieh.
M.Sc. Thesis, Oregon State University, June 1970. 149 p, 38 fig, 16 tab, 79 ref, 4 append. OWRR Project A-001-OREG (6).

Descriptors: *Storm runoff, *Small watersheds, *Lumbering, *Oregon, Overland flow, Road construction, Forest fires, Streamflow, Flow rates, Peak discharge, Vegetation effects, Hydrology, Rainfall, Topography, Climates, Soils, Geology, Mathematical studies, Equations, Clear-cutting.
Identifiers: *Runoff response variables, *Logging (Timber).

The effects of roadbuilding, logging, and forest burning upon stream runoff responses to storms are evaluated for the Alsea experimental watersheds, located in the Oregon Coast Range. The parameters analyzed are peak discharge, time-to-peak, and storm-runoff volume. The volume parameter is further subdivided into toal, quick, delayed, rising limb, and falling limb flows. The control-watershed approach and linear regression method are utilized. Calibration of the main stations at Flynn Creek (502 acres) and Deer Creek (750 acres) started in 1958. That for subwatershed DC II (138 acres) and DC III (100 acres) started in 1962. The storm-runoff responses were related to the type of treatment applied and percent of area treated. Roadbuilding resulted in significant increases in peak and induced peak discharges on DC III, which was subjected to the most intensive treatment. Logging generally caused greater runoff than did roadbuilding, because more vegetation was removed. Rising limb flow on DC III as well as at the Deer Creek main station was moderately increased after logging. Effects on design floods after treatments were indicated by the sharp increases in peak discharges, based upon flood frequency and statistical analyses. (Woodard-USGS)

THE ESTABLISHMENT OF VEGETATION ON NONTOPSOILED HIGHWAY SLOPES IN WASHINGTON,
Washington State Univ., Pullman. Agricultural Research Center.
Roy L. Goss, Robert M. Blanchard, and William R. Melton.
Available from NTIS as PB-196 158, $3.00 in paper copy, $0.95 in microfiche. Final Report Research Project Y-1009, Nov 1970. 29 p, 8 fig, 6 tab, 24 ref. DOT supported.
Identifiers: *Highways, *Vegetation, *Erosion control, Washington State, *Landscaping, Highways, Slopes, Loams, Grasses, Mulches, Straw, Asphalts, Emulsions, Subsoil, Fertilizers.

Various factors of erosion control and vegetation establishment were studied over a four year period in Washington. Included were: (1) establishment of grass/legume cover without the use of topsoil, (2) species of grasses and clover and proportion of each, (3) mulching materials and (4) fertilization. Erosion control vegetation can be established on subsoils without topsoil. There were no differences found among genera and species of seed tested. Subsoils, as exposed from construction, supported good stands of grass provided adequate fertilizers were supplied and they were given proper protection (mulching) from erosion. On erodible sites on 2:1 slopes or steeper, excelsior matting or straw tacked with asphalt emulsion was superior to all other materials tested. Refertilization is important.

DISTRIBUTION OF BACTERIA IN FECES OF SWINE,
Missouri Univ., Columbia.
Gloria D. Rall, Arletta J. Wood, R. B. Wescott, and A. R. Dommert.
Applied Microbiology, Vol 20, No 5, p 789-792, Nov 1970. 3 tab, 2 fig, 12 ref. Public Health Service grants RR-00390 and RR-00285.

Descriptors: *Bacteria, *Distribution, Farm wastes, Patterns, Microorganisms, Pollutant identification.
Identifiers: *Fecal samples, *Swine, Frequency, Distribution.

A new technique is described for evaluating bacterial cell distribution in fecal samples. Spatial rela-

tionships of cells within an area rather than number of cells per unit volume or weight are measured by this technique. Measurements of cell distribution by this method indicated that bacteria occurred in freshly voided swine feces as pure, discrete colonies rather than as single cells distributed randomly or uniformly throught the sample. (Christenbury-Iowa State)

ODOR TRANSPORT BY PARTICULATE MATTER IN HIGH DENSITY POULTRY HOUSES,
Cornell Univ., Ithaca, N.Y. Dept. of Food Science.
William E. Burnett.
Poultry Science, Vol 48, No 1, p 182-185, 1969. 1 fig, 1 tab, 9 ref.

Descriptors: *Farm wastes, *Poultry, *Odor, Gas chromatography, Volumetric analysis, Volume, Filters, Nitrogen, Organoleptic properties, Ventilation, Pollutant identification, Air pollution, Pollution abatement.
Identifiers: *Particulate matter, Odor transport, Odor panel, Volatiles, Concentrations, Odoriferous components.

The report investigates the concentrations of airborne particulate matter in a high density poultry house and the role of particulate matter as an odor transport mechanism. Particulate matter collected by high volume samplings, of a commercial poultry house atmosphere revealed that the particulates had a 'chicken house' odor. Gas chromatographic analyses of the volatiles carried by the particulates revealed the presence of a number of individually odoriferous compounds. Large quantities of particulate matter are probably expelled from poultry houses by ventilation fans. Whether particulate matter plays a significant role in ambient odors from poultry houses should be investigated since the particulates represent a retentive source of odors. (White-Iowa State)

AUTOMATED METHOD FOR DETERMINING AND REMOVING SILICA INTERFERENCE IN DETERMINATION OF SOLUBLE PHOSPHORUS IN LAKE AND STREAM WATERS,
Guelph Univ. (Ontario). Dept. of Soil Science.
F. Ross Campbell, and R. Leslie Thomas.
Environmental Science and Technology, Vol 4, No 7, p 602-604, 1970. 2 fig, 1 tab, 9 ref.

Descriptors: *Analysis, *Analytical techniques, *Color reactions, Data collections, Ammonium compounds, Phosphorus, Silica, Automation.
Identifiers: *Ammonium molybdate, Auto-analyzer techniques.

The ability of ammonium molybdate to attain blue color in the presence of not only phosphorus, but also silica, yields erroneous results in analyses of lake and stream waters. The deviations are of particular importance when the concentration of phosphorus is in the low microgram/liter range. The method described in this report permits an automated simultaneous determination of soluble phosphorus and the silica interference. (Wilde-Wisconsin)

DETERMINATION OF PROTEIN IN WASTE WATER,
Texas Western Coll., El Paso. Dept. of Civil Engineering.
Calvin Woods.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, 6, 1965, Purdue University, Vol XLIX, No 4, July 1965, p 501-515. 7 fig, 4 tab, 16 ref.

Descriptors: *Protein, *Nitrogen, *Colorimetry, Color, Calibrations, Peptides, Carbohydrates, Ammonia, Temperature, Waste water treatment, *Pollutant identification, *Analytical techniques.
Identifiers: *Kjeldahl method, Folin reaction, Biuret reaction, Sensitivity, Optical density, Interference, Tyrosone, Tryptophan.

The Kjeldahl organic nitrogen method, the Folin colorimetric method, and the Biuret reaction were analyzed as to their ability to determine the amounts of protein present in a solution. The Kjeldahl method measures organic nitrogen in the solution. Since protein is approximately 16% nitrogen, the nitrogen concentration is assumed to be entirely present in the protein structure and is multiplied by 100/16 or 6.25 to give the protein concentration. This method requires specialized equipment, is expensive, and time consuming. The Biuret reaction involves addition of a weak concentration of copper sulfate to an alkaline solution of proteins to yield a characteristic purple color, indicating the presence of a peptide bond. However, ammonia must be removed prior to the test since it interferes with the reaction. The amount of color developed depends upon the number of peptide bonds present so each protein has a different color. This reaction is the least sensitive of the methods discussed. The Folin reaction is the result of two reactions: the reaction of copper with protein in an alkaline solution and the reduction of the phosphomolybdic-phospho-tungstic reagent by the copper treated protein. This reaction has no known interferences, it is 100 times more sensitive than the Biuret reaction, it is easy to perform, and it is the only one specifically adapted to determining the soluble protein content of waste waters after centrifugation. (Lowry-Texas)

ENERGY, TOTAL CARBON, AND OXYGEN DEMAND,
Rice Univ., Houston, Tex. Dept. of Chemical Engineering.
A. W. Busch.
Proceedings Industrial Waste Conference, 20th, May 4, 5, 6, 1965, Purdue University, Vol XLIX, No 4, p 457-469, July 1965. 6 fig, 2 tab, 25 ref.

Descriptors: *Organic matter, *Oxygen demand, *Energy, Carbon, Thermodynamics, Biological treatment, Biochemical oxygen demand, Biodegradation, Chemical oxygen demand, Waste water treatment, Oxidation, Organic wastes, *Pollutant identification.
Identifiers: *Total carbon, Substrate, Total carbon analyzer, Organic pollution.

Certain concepts held basic to the measurement of organic pollution are emphasized and data relating to the use of parameters other than oxygen consumption for organic pollution definition and measurement are presented. Only soluble organics are of basic significance in biological oxidation. Work at Rice University has resulted in the definitions of two methods for the measurement of biodegradable soluble organics: (1) a materials balance technique of extreme precision suited only for research work, and (2) a rapid, mass culture technique of plus or minus 10 percent precision suitable for waste characterization process design, and plant control. The application of thermodynamic concepts derived for reversible reactions at equilibrium to biological reactions which operate at a point remote from equilibrium seems hazardous. Total carbon changes during bio-oxidation provide a significant and useful measure of the reaction and the bio-degradable organic content. The ease and rapidity of the mass culture technique in conjunction with the total carbon analyzer offers an exciting prospect for definitive pollution measurements. (Ellis-Texas)

NUTRIENTS IN STREAMS DRAINING WOODLAND AND FARMLAND NEAR COSHOCTON, OHIO,
Agricultural Research Service, Beltsville, Md. Soils Lab.
A. W. Taylor, W. M. Edwards, and E. C. Simpson.
Water Resources Research, Vol 7, No 1, p 81-89, February 1971. 9 p, 3 fig, 6 tab.

Descriptors: *Nutrients, *Runoff, *Forests, *Farms, *Ohio, Nitrogen, Nitrates, Phosphates, Potassium, Data collections, Water quality, Path of pollutants, Eutrophication, Appalachian Mountain Region, Farm wastes, Statistical methods, Fertilizers, Leaching, Water pollution sources.
Identifiers: Woodlands, Farm lands, Coshocton (Ohio).

Nitrogen, phosphate, and potassium concentrations were measured in streams draining woodland and farmland watersheds at Coshocton, Ohio 1966 through 1969. Temporal variations in the nutrient concentrations were much smaller than the changes in the rate of streamflow. No relationship was found between any nutrient concentration and streamflow, and no seasonal changes in concentration were detected. Nutrient losses from farmland were significantly greater than those from woodland. The nitrate-N concentration in the farm runoff was below 2 ppm except for one short period when it rose to 10 ppm. The input of nitrogen in the rain was greater than the loss in runoff from both watersheds. The average concentration of phosphate in runoff was 22 ppb (of P) from the farm and 15 ppb from the woodland. The analysis of the data shows that total nutrient losses cannot be calculated meaningfully unless both hydrologic and chemical data are available. The volume of water flow is the most important variable in this calculation. (Knapp-USGS)

MODEL OF HYDROLOGIC REDISTRIBUTION OF RADIONUCLIDES AROUND NUCLEAR-EXCAVATED SEA-LEVEL CANALS,
Isotopes, Inc., Palo Alto, Calif. Palo Alto Labs.
R. L. Charnell, D. E. Holly, and P. R. Fenske.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970; Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/51, p 801-814, 1970. 14 p, 5 fig, 14 ref. USAEC Contract AT (26-1)-171.

Descriptors: *Radioecology, *Fallout, *Leaching, *Path of pollutants, *Nuclear engineering, Nuclear explosions, Canals, Canal construction, Groundwater movement, Infiltration, Navigation, Seepage.
Identifiers: *Venezuela, *Nuclear canal excavation.

As part of the bioenvironmental and radiological-safety feasibility studies for nuclear excavation of a sea-level canal in Central America, a model was developed to estimate the rate at which excavation-produced radionuclides are redistributed by natural hydrologic processes. The model can be used to estimate the amount of a specific radionuclide available for interaction with plant, animal, or man. The model was formulated for two distinct regions: in the canal channel itself and the region away from the canal where dust and fine particles are deposited as wind-distributed fallout. For the fallout zone portion of the model, redistribution is controlled by the initial removal by rainwater leaching. The amount of radionuclide which is removed with rainfall is represented by the simple distribution coefficient Kd). Once the nuclide is dissolved, its rate of entry into the groundwater reservoir and into the stream can be determined from soil density and porosity, long-term infiltration rates, and some pre-excavation hydrologic data. This model was applied to two of the proposed canal sites in Panama and Colombia. For radionuclides with distribution coefficients higher than 100, concentration of the radionuclide in river water continues at a near constant level decreased only by radioactive decay. Removal from the land surface by leaching is not significant during the first year following excavation. On the other hand, for nuclides with distribution coefficients less than 100, leaching removal from the land surface is significant in one year and the concentration in streams drops rapidly. (Knapp-USGS)
W71-04882

DISTRIBUTION AND MIGRATION OF LEAD IN GROUND WATERS,
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
G. A. Goleva, V. A. Polyakov, and T. P. Nechayeva.
Translated from Geokhimiya, No 3, p 344-357, 1970. Geochemistry International, Vol 7, No 2, p 256-268, 1970. 13 p, 4 fig, 5 tab, 18 ref.

Descriptors: *Water chemistry, *Leaching, *Heavy metals, Oxidation, Acid mine water, Sulfides, Sulfates, Ion transport, Mine water, Mine acids, Solubility, Water pollution sources, Path of pollutants, Solutes.
Identifiers: *Lead.

Anomalous lead contents in natural waters are related to oxidation of Pb-bearing sulfide deposits or leaching from rocks by chloride and bicarbonate waters. Maximum lead contents of 3-5 mg/liter are found in mine waters on deep-seated thermal fluids. In solution Pb forms important complex ions with each of the principal anions in natural waters. Migration of lead is limited in sulfate solutions by the low solubility of sulfate compounds, and in alkaline waters by precipitation of Pb (OH)2. Lead forms a number of stable metal-organic complexes, and is readily sorbed from solution as positively charged complexes. Hydrochemical lead anomalies are restricted and are among the best indicators of sulfide ore deposits. (Knapp-USGS)

EFFECTS OF MANURE DEPTH ON RUNOFF FROM SOUTHWESTERN CATTLE FEEDLOTS,
Texas Tech Univ., Lubbock.
L. L. Keeton, W. Grub, D. M. Wells, G. F. Meenaghan, and R. C. Albin.
Paper presented at the 1970 winter meeting American Society Agricultural Engineers, Chicago, December 8-11, 1970, Paper No 70-910. 7 p, 2 tab, 1 ref.

Descriptors: *Rainfall intensity, *Rainfall-runoff relationships, Farm wastes, Pollutants, Moisture content, Biochemical oxygen demand, Chemical oxygen demand, Waste water treatment, Water pollution sources.
Identifiers: Feedlot runoff, Feedlot slope, Water holding capacity.

With the increasing number of beef cattle in feedlots in the Southwestern United States has come a major water pollution problem. The effects of manure accumulation on quantity and quality of runoff from concrete and direct surfaced feedlots for various precipitation rates were determined. A relatively dry manure pack holds approximately one-half inch of rainfall per inch of manure depth. If runoff from a relatively dry mass occurs, large quantities of suspended and dissolved pollutants are carried off. Manure at 60 percent moisture minimizes the pollutants removed during feedlot runoff. The quality of feedlot runoff is primarily a function of the moisture content of the manure, the rainfall intensity, and the feedlot slope. (Christenbury-Iowa State)

WATER QUALITY CHARACTERISTICS OF THE NEW HOPE AND LOWER HAW RIVERS JULY 1966 - FEB. 1970 WITH ESTIMATES OF THE PROBABLE QUALITY OF NEW HOPE LAKE,
North Carolina Water Resources Research Inst., Raleigh; and North Carolina Univ., Chapel Hill. Dept. of Environmental Biology.
Charles M. Weiss.
Available from NTIS as PB-197 720, $3.00 in paper copy, $0.95 in microfiche. North Carolina Water Resources Research Institute Report No. 48, January 1971. 139 p, 5 tab, 24 fig, 23 ref, 4 append. OWRR Project B-007-NC (2).

Descriptors: *Eutrophication, *Limnology, Waste assimilative capacity, Hydrogen ion concentration, *Water pollution effects, *Water quality, North Carolina, *Water pollution sources, Lakes, Oxygen requirements, Oxygen demand, *Sampling, Temperature, Turbidity, Conductivity, Dissolved oxygen, Nitrogen, Phosphorous, Chlorophyll, Biochemical oxygen demand.
Identifiers: New Hope Reservoir, New Hope River, Haw River, Oxygen balance, Waste water loading, Residues, Oxygen saturation, Index organisms.

The water quality characteristics of the lower Haw River (Saxapahaw to the juncture with the New Hope River) and the New Hope River (downstream of Chapel Hill and Durham) have been evaluated on the basis of 19 water quality parameters. The stations on the New Hope River were sampled in the period July 1966 - February 1970 and the Haw River from December 1967 to February 1970. Projections, based on the estimates of the quality of the two river systems have been made of the probable water quality that might be expected in the New Hope Lake. Although water quality degrading materials transported by the Haw River are greater by factors of 5 to 7 times that of the New Hope, the oxygen balance in the Haw River at the location of the new lake indicates that the upstream contributions of oxygen consuming materials have been essentially stabilized and the oxygen resources of the Haw River are near normal. In contrast, although the New Hope River transports a substantially smaller pollution load in terms of quality degrading materials per unit of time, oxygen assets have not recovered to the same extent as in the Haw. Due to longer detention times, it is estimated that the overall quality of the waters in the new impoundment will be controlled primarily from pollution from the New Hope drainage. (Howells-North Carolina)

ESTIMATING POPULATION EXPOSURE TO SELECTED METALS - TITANIUM,
Research Triangle Inst., Durham, N.C.
W. Kenneth Poole, and Donald R. Johnston.
Available from NTIS as PB-195 819, $3.00 in paper copy, $0.95 in microfiche. Report No NIH-ES-2434, March 1969. 101 p, 8 fig, 23 tab, 50 ref. Contract No PH-86-65-109.
Identifiers: *Titanium, *Public health, *Food contamination, Titanium, *Industrial medicine, *Air pollution, *Water pollution, Exposure, Toxicity, Rutile, Mining, Pigments, Welding rods, Titanium alloys, Titanium dioxide, Metal working, Environmental surveys, Lung.

The report is intended to cover the flow of titanium from the time it is mined until it is consumed; the exposure of sub-populations occupationally exposed to titanium; and the exposure of the general population to titanium via air, food and water. Occupational exposure to titanium in the air has been found to be virtually absent. Apart from open pit operation, the mining industry has no significant exposure problem. Among manufactureres using titanium concentrates, pigment plants and titanium metal plants have been suggested as sources of possible excessive exposure. Food appears to be the most significant source of titanium exposure to the general population. Estimated daily titanium dose from a typical diet is 607microgram. Normal water intake is 3 microgram.

VERTICAL MOLECULAR DIFFUSION OF XENON-133 GAS AFTER INJECTION UNDERGROUND,
Geological Survey, Idaho Falls, Idaho.
John B. Robertson.
For sale by Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $3.75. Geological Survey Research 1970, Chapter D, Professional Paper 700-D, p D287-D300, 1970. 14 p, 8 fig, 2 tab, 10 ref.

Descriptors: *Diffusion, *Path of pollutants, *Nuclear wastes, *Tracers, *Radioactivity techniques, Aquifers, Idaho, Distribution patterns, Injection wells, Waste disposal, Radioactive wastes, Playas.
Identifiers: Gas diffusion, Xenon radioisotopes, *Waste disposal wells.

Nine hundred and eighty-seven curies of radioactive Xe-133 gas mixed with 28,300 cu m of air was injected rapidly into permeable basalt strata at the National Reactor Testing Station, Idaho. A capping layer of fine-grained playa sediments confined the gas underground. The subsurface Xe-133 was monitored by Geiger-Mueller detectors and by air samples from observation wells surrounding the injection well. Most of the Xe-133 apparently remained underground and decayed radioactively. Molecular diffusion rates of Xe-133 from the ground were estimated using a simplified mathematical model. A maximum flux rate of 2,
microcuries/hr from a ground-atmosphere ir
face area of 26,700 sq m was calculated for the
day after injection. The estimated rates indicat
total diffusion loss of 0.37 c for the total area
ing the 26-day observation period. The calcul
rates had fairly good agreement with the meas
flux rates at the ground surface. Erratic variat
in the measured flux rates were attributed to o
influences such as barometric-pressure chan
(Knapp-USGS)

*Farm wastes, *Confinement pens, Colifor
Nitrates, Nutrients, Solutes, Soil water movem
Groundwater, Washington, Water pollu
sources, Chlorides, Soil moisture.
Identifiers: FeedlotsCattle), Outwash (Glacial).

A test drilling program was conducted at a dair
the Spokane Valley, Washington, to determine
effects of feedlot operation on groundwater qu
ty. Coliform bacteria, enterococci, and fe
coliforms were found to disappear within a relati
ly few feet of the ground surface. Chlorides
nitrates, however, were persistent in depth and
actually reach the groundwater body. The
natural moisture content of the soil, coupled w
the apparent high moisture tensions, suggests t
soil moisture is not presently moving downward
the system. It is concluded that the downw
migration of inorganic chemicals from the feed
environment must represent an early phase of
operation, which is arrested as organic mattes
formed in near-surface layers. (Knapp-USGS)

tion, *Solid wastes, *Waste disposal, Surfa
wasters, Groundwater, Garbage dumps, Landfi
Waste dumps, Water pollution, Precipitation (A
mospheric), Seepage, Infiltration, Groundwa
movement, Hydraulics, Surface runoff, Strean
Soil types, Permeability, Floods, Evaluatio
Planning.
Identifiers: *Urban hydrology.

The disposal of more than 1,400 million pounds
solid wastes in the United States each day is a maj
problem. Four disposal methods-open dumps, sa
tary landfill, incineration, and onsite disposal-ca
an inherent potential for pollution of wat
resources. Seepage of rainwater through the wast
leaches undesirable constituents which reach t
groundwater in the area. This leachate is genera
both biologically and chemically contaminate
Pollution potential is highest in permeable are
with a shallow water table where the wastes are
direct contact with the groundwater. Site selecti
for disposal of solid wastes must be based
adequate water-resources information if poll
tional potential is to be minimized. This will requi
regional as well as localized data on the wat
resources of the area. Only through such an a
proach can adequate protection be afforded to t
environment in general and the water resources
particular. (Woodard-USGS)

TEST SIMULATION OF THE TEMPERA-
URES OF THE DEERFIELD RIVER,
ttelle Memorial Inst., Richland, Wash. Pacific
orthwest Lab.
T. Jaske.
SAEC Contract at (45-1)-1830. AEC Research
d Development, Report No BNWL-628, UC-80,
c 1967. 41 p, 9 fig, 3 tab, 6 ref.

escriptors: *Thermal pollution, *Temperature,
recasting, Density, Flow profiles, Meteorological
a, Massachusetts, Water pollution sources.
ntifiers: *Deerfield River, COL HEAT simula-
n system, Thermal discharge, Advected heat,
avel time, Currents.

o test simulations involving adaptation of the
ital simulation system were performed using ac-
l data collected in two sidely differing drainage
ins. The report summarizes the results of the
erfield simulation. It uses temperature records
lected by the New England Power Company
ing the period of 1960 through 1963. It is con-
ded that the COL HEAT simulation system is
erally adequate to represent the water tempera-
e regime of the Deerfield River within the accu-
y of the input data presented for evaluation. The
a required for operation of the temperature
del are water temperature at the inlet and outlet
, form of discharge at the outlet, meteorological
ameters, river or reservoir dimensions reduced
equivalent non-parallel trapezoidal cross sec-
s, and advected heat quantities. A hypothetical
mal discharge of 300 MW directly into the
r was performed as an exercise in predictive
ability of the model. The results indicate that
n 10 to 30 percent of this heat would remain
ng the summer months and 40 to 60 percent
ng the cooler months in the river at a station 27
s below the hypothetical discharge point. (U-
nyaya-Vanderbilt)

CHENA RIVER, THE STUDY OF A SUB-
IC STREAM,
l Water Quality Administration, College,
. Alaska Water Lab.
Paul J. Frey, Ernst W. Mueller, and Edward C. Berry.
Available from NTIS as PB-197 857, $3.00 in paper copy, $0.95 in microfiche. October 1970. 96 p, 14 fig, 26 tab, 57 ref. FWQA Project No 1610--10/70.

Descriptors: Benthos, Chemical oxygen demand, Coliform, *Dissolved oxygen, Diversification, Fisheries, *Flood control, Freezing, Nutrients, Plankton, Water pollution sources, Reaeration, Sewage, Temperature, *Water quality, Water pollution effects, *Alaska, Subarctic, Flow.
Identifiers: *Chena River (Alas), Fairbanks (Alas), Break-ups, *Subarctic streams.

The Chena River is a subarctic stream flowing westerly from the low mountains of eastern Alaska to the Tanana River near Fairbanks. It is typical of many Interior Alaska rivers with the exception that its lower reaches are highly polluted by domestic and industrial wastes from the Fairbanks area. The purpose of this 3-year study of the river was to understand the physical, chemical, and biological limnology of the river system and what effect man's influence--past, present and future--has on the river. Dissolved oxygen was one of the most critical parameters determined. In the summer it is close to saturation. During winter, in the lower river, the concentration approaches 1 mg/1. The biological community was studied through both quantitative and qualitative plant and animal collections. The upper reaches of the river are much richer in number of kinds of organisms than the lower reaches. Coliform bacteria counts range from very low in the upper river to over 500,000 per 100/ml below Fairbanks. A flood control dam is planned for the river above the city of Fairbanks. Significant modification of the water quality and biota of the river can be expected following the construction of the dam. Proper management of the flow from the impoundment can reduce the objectionable effects of this dam on the river system.

OCEANOGRAPHIC OBSERVATIONS OF OIL SLICKS DURING THE CHEVRON SPILL, MARCH, 1970,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
Stephen P. Murray, William G. Smith, and Choule J. Sonu.
Available from NTIS as AD-714 260, $3.00 in paper copy, $0.95 in microfiche. Technical Report No 87, Sept 1970. 106 p, 34 fig, 6 tab, 37 ref. ONR Project NR-388002.
Identifiers: *Water pollution, *Oils, *Estuaries, *Mexico Gulf, Water pollution, Wind, Water waves, Interactions, Tides, Seacoast, Temperature, Salinity, Deltas, Density, Predictions, Data processing systems, Diffusion, Statistical data, Petroleum, Mississippi, Petroleum industry, *Oil slicks, *Oil pollution, Mississippi River, *Oil wells, Blowouts, Oceanographic data.

Oceanographic observations near the Chevron spilling well off the Mississippi Delta in March 1970, revealed relative roles of various physical factors of the regional estuarine system in the behavior of oil slicks. Surface stress from the wind was most important; at speeds above 15 mph the slick orientation was generally determined by the wind direction. The wind also indirectly affected oil which was sunk by dispersant in that wind waves promoted mixing, which in turn affected the vertical stability, hence eventually the velocity profile. Wind setups and setdowns were correlated with downward and upward isopycnal movements, respectively. Both calculations and observations showed that tidal currents produced an L-shaped slick geometry when winds were below about 15 mph. The diurnal rotation of the tidal currents served to limit the excursion length of oil from the source, keeping it short of the nearest shore. The presence of fresh water from the Mississippi River in the surface layer and the consequent development of convergence lines often formed a natural barrier, preventing oil from encroaching upon the shore. Theoretical analysis using turbulent diffusion theory disclosed that the area and length of a steady-state oil slick increased with oil discharge but decreased with current speed and the lateral diffusion coefficient.

Proceedings, Industrial Waste Conference, 21st, May 3,4,5, 1966, Purdue University, Vol L, No 2, March 1966, p 117-124. 2 fig, 13 ref.

Descriptors: *Biota, *Industrial wastes, *Effluents, Aquatic life, *Toxicity, Biology, Microbiology, Water pollution sources.
Identifiers: *Biomonitoring, Aquarium.

This system allows for continuous surveillance over the toxicity of an effluent and has the following objectives: (1) to demonstrate the continuous suitability of an effluent for aquatic life provided slow-acting or cumulative toxins are not involved; (2) to detect change in the biological acceptability of the effluent itself; and (3) to detect change in the effect of effluent on the biota of the receiving waters. Objective 1 can be accomplished through the use of an aquarium but objectives 2 and 3 are considerably more difficult. A single basic design of exposure tanks and a flow plan are presented as a means to accomplish objectives 2 and 3. Effluent supply, dilution water, proportioning of flow and test animals are discussed to enhance the ideas presented. (Ellis-Texas)

TRANSPORT ANALYSIS-BASIC PREDICTIVE APPROACH OF THE MOVEMENT OF POLLUTANTS THROUGH SOIL,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Lab.
D. B. Cearlock.
Proceedings, Industrial Waste Conference, 21st, May 3, 4, 5, 1966, Purdue University, Vol L, No 2, p 516-526, March 1966. 5 fig, 8 ref. US Atomic Energy Commission Contract AT (45-1)-1830.

Descriptors: *Soil water movement, Diffusion, Darcy's Law, Dispersion, Convection, Biological, Chemical, Physical, *Path of pollutant, Water pollution sources.
Identifiers: *Transport analysis, Macroscopic, Miscroscopic.

To insure applicability of one-dimensional laboratory investigations to multi-dimensional field problems, two phenomena, fluid movement and pollutant reactions, were investigated separately and equations were developed to predict pollutant transport through soil. The fluid movement component of the transport equation groups together all mechanisms that transport the pollutants such as convection, diffusion, and dispersion. The reaction component includes all reactions that occur between the pollutant and its environment such as biological, chemical, and physical aspects. (Ellis-Texas)

5C. Effects of Pollution

EUTROPHICATION,
Wisconsin Univ., Madison. Water Resources Cneter.
G. Fred Lee.
Available from Ntis as PB-197 697, $3.00 in paper copy, $0.95 in microfiche. Wisconsin Univ, Madison, Water Resources Center, Eutrophication Information Program Occasional Paper No 2, 1970. 39 p, 1 fig, 2 tab, 37 ref. OWRR Project W-117 (No 1614) (2).

Descriptors: *Eutrophication, *Lakes, *Water pollution sources, *Water pollution control, Water quality, Pollution abatement, Nutrients, Phosphorus, Nitrogen, Classification, Measurement, Trophic level.
Identifiers: Eutrophication classification, Eutrophication measurement, Lake classification.

The eutrophication process is described giving lake characteristics and classification. Causes of eutrophication are discussed, including factors influencing aquatic plant production, types of aquatic plant nutrients, together with concentration and sources of nitrogen and phosphorus, which include domestic and industrial waste waters, urban and agricultural drainage and natural sources; the role of lake sediments, atmospheric sources, groundwaters, marshes, and nitrogen fixing bacteria and their interaction with nitrogen and phosphorus sources are outlined. The parameters to be considered in measurement of eutrophication are evaluated. Effect of eutrophication on domestic, industrial, and recreational uses of water are outlined. A summary of methods used in reducing and controlling effects and rate of eutrophication includes nutrient removal from waste waters, waste water diversion, dredging, flushing, chemical and biological control of nuisance plant growth, harvesting, lake aeration, control of agricultural sources of nutrients and control of urban drainage, hypolimnetic withdrawal, water level management, and immobilization of nutrients. AIR POLLUTANTS AFFECTING THE PERFORMANCE OF DOMESTIC ANIMALS - A LITERATURE REVIEW.
Agriculture Research Service, Washington, D.C.

For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $1.00. Agriculture Handbook No 380, Issued August 1970. 109 p, 666 ref.

Descriptors: *Domestic animals, *Air pollution effects, *Toxicity, Pollutant identification, Air pollution, Atmsophere, Smoke, Pollutants, Physiological Ecology, Legislation, Farm wastes, Laboratory studies, *Reviews, *Bibliographies, Water pollution effects.
Identifiers: Inhalation, Ingestion, Veterinary diagonosis, Esthetic effects, Automobile exhausts.

The results of a Literature Survey to determine the effects of air pollution on domestic animals is presented. The term 'domestic animals' as used in this report includes cattle, sheep, goats, swine, horses, chickens, turkeys, ducks, geese, pigeons, Japanese quail, dogs, cats, rabbits, and honey bees. Chapters 2, 3, and 4 on air pollution, smoke, and automobile exhausts provide a brief background on the generalities of these pollutants and their effects on domestic animals. Many of the specific air pollutants found in the air, smoke, and automobile exhausts are described in subsequent chapters, which contain a brief introduction of the air pollutant, the published results, a summary, and a bibliography. OBSERVATIONS ON THE EFFECT OF THE RE-USE OF BROILER LITTER ON THE INCIDENCE OF MAREK'S DISEASE,
Delaware Univ., Newark.
G. W. Chaloupka, R. W. Lloyd, J. F. Gordy, and L. M. Greene.
Poultry Science, Vol 47, p 1660, 1968.

Descriptors: *Farm wastes, *Condemnation, *Poultry, *Disinfection, Public health, Pollution abatement, *Diseases.
Identifiers: *Marek's disease, Broiler house, Litter re-use, Leucosis, Immunity, Causative agent.

Four different studies involving several trials have been conducted at the University of Delaware Substation in which the performance of broilers grown on re-used litter was compared to those grown on new litter. These studies over a period of several years have shown that broiler condemnations due to leucosis have in most instances been lower for the broilers grown on re-used litter. This substantiates the findings of many field studies and by at least one private research farm. These results would indicate that a failure to clean out and disinfect the broiler house before placing each new lot of chicks is not a primary factor in increasing the incidence of Marek's disease. It is not known whether these results are due to developing a partial immunity due to contact with the caus agent in the litter at an early age, or whethe causative agent is destroyed in some way ir reused litter. HE EFFECT OF VARYING AMOUNTS AND RATIOS OF NITROGEN AND PHOSPHATES ON ALGAE BLOOMS,
Academy of Natural Sciences of Philadelphia, Pa. Dept. of Limnology.
Ruth Patrick.
Proceedings, Industrial Waste Conference, 21st, May 3, 4, 5, 1966, Purdue University, Vol L, No 2, March 1966, p 41-51. 6 tab, 6 ref.

Descriptors: *Nitrogen, *Phosphates, *Algae, Eutrophication, Diatoms, Microbiology, Nitrates, Ammonia, Water pollution effects, Waste water treatment, Pennsylvania.
Identifiers: *Glucose, Waterloo Mills (Pa).

A series of experiments was undertaken at the Waterloo Mills Field Research Station to try to determine the effect of nitrogen as nitrates or ammonium and phosphates in varying amounts and ratios on natural communities of diatoms. Some experiments were carried out to determine the effects of adding small amounts of glucose to these enriched waters. Certain species increased in abundance with increases in nitrogen as nitrates and/or a ammonium and with increases in phosphates and some of them with the addition of small amounts of glucose. However, the heavy diatom growths which often occur in streams enriched with effluents from sewage treatment plants did not occur which indicates other factors are important to the growth of diatoms and hence, algal blooms. (Ellis-Texas)

HE EFFECT OF NITRIFICATION OF ORGANIC WASTES ON WATERS IN THE NATURAL ENVIRONMENT-I. EFFECTS OF SEED,
Maine Univ., Orono. Dept. of Civil Engineering.
Harry A. Patrie, K. Keshavan, and Franklin E. Goodard.
Proceedings Industrial Waste Conference, 21st, May 3, 4, 5, 1966, Purdue University, Vol L, No 2, p 869-879, March 1966. 4 fig, 6 tab, 13 ref.

Descriptors: *Nitrification, *Nitrates, Dissolved oxygen, Oxygenation, Deoxygenation, Bacteria, Organic wastes, Water pollution effects, Waste water treatment, *Biochemical oxygen demand.
Identifiers: *Nitrogeneous BOD, *Carbonaceous BOD, *Nitrifiers, Seed, Assimilation capacities, Examination, Deoxygenation, Synthetic waste.

The standard five-day BOD test is questioned as to its reliability in simulating stream conditions. It was previously supposed that BOD progression always allowed two distinct steps, the carbonaceous and then the nitrogenous. Observations of stream conditions and laboratory experiments showed that when active nitrifiers are present initially in sufficient numbers, both the carbonaceous and the nitrogenous demand are exerted simultaneously, and the oxygen uptake becomes nearly exponential. Comparisons between raw sewage and synthetic sewage, part seeded with nitrifying bacteria, and part unseeded were made. Average BOD exertion was 11% higher in the seeded bottles than the unseeded one, and nitrate production ranged as much as 3120% higher in seeded samples than in unseeded samples. These results showed that nitrification was not suppressed by carbonaceous oxidation when sufficient active nitrifiers were present, and that this nitrification was a significant factor in the oxygen depletion of the sample. Therefore, it is imperative that a proper bacterial seed must be selected for the BOD test to avoid serious discrepancy between predicted and actual dissolved oxygen levels in a natural body of water. (Lowry-Texas)

LAKES--RESTORATION AND PRESERVATION,
Federal Water Quality Administration, Cincinnati, Ohio. Field Investigations Branch.
Lowell E. Keup, and Kenneth M. Mackenthun.
Water and Sewage Works, 1970 Reference Number, Vol 117, p R16-R21, November 28, 1970. 6 p, 2 tab, 18 ref.

Descriptors: *Lakes, *Eutrophication, *Aquatic weed control, *Ecology, *Water quality, Preservation, Control, Limnology, Surface waters, Environmental effects, Self-purification, Lake soils, Sedimentation, Methodology, Nutrients, Water pollution, Streamflow, Runoff, Biological treatment, Wastes, Sewage.
Identifiers: *Lake preservation, Plant ecology.

Problems concerned with lake eutrophy and methods of lake restoration and preservation are discussed. The ultimate end of eutrophy is the elimination of a lake or reservoir. Before this end is reached, a number of undesirable conditions develop that are frequently due to increased biological production in the lake. For example, larger standing crops of algae and pond weeds produce undesirable tastes and odors in water to interfere with public supplies and to increase solids that must be removed. When the plant life dies it contributes to deoxygenation, a problem particularly significant in deep waters of stratified lakes where anaerobisis induces increased sulfide, iron and manganese concentrations. Each lake must be examined before its problem can be assessed and preventive measures initiated to check eutrophy. The nutrient that offers the best chance for control with the least side-effects appears to be phosphorus. It can be removed from waste waters with 99 plus percent efficiency by precipitating calcium (lime), iron, aluminum (alum) or copper ions. (Woodard-USGS)

EFFECT OF HANFORD PLANT OPERATIONS ON THE TEMPERATURE OF THE COLUMBIA RIVER, 1964 TO PRESENT,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
R. T. Jaske, and M. O. Synoground.
AEC Research and Development Report, BNWL-1345, UC-70, Nov 1970. 259 p, 48 fig, 38 tab, 79 ref.

Descriptors: Temperature, Forecasting, Least squares method, Reservoirs, Ecology, Computer programs, Instrumentation, Mixing, Radioisotopes, Columbia River, Washington, Oregon, Water pollution effects.
Identifiers: Hanford Plant (Wash).

This study is primarily concerned with the changes in temperature in the Columbia River as a result of dam construction and the Hanford works. Routine radiological aspects are not included. The data was analyzed by means of a nonlinear, maximum likelihood, least squares fit, routine capable of handling non-linearity and saddlepoints reliably. It is concluded that the erection of hydraulic power dams and reservoirs on the Columbia River has had only a minimal effect on the annual mean temperature of the entire system. Studies of the thermal dissipation of reactor effluent indicate that a majority of the heat is dissipated before the confluence of the Snake and the Columbia. Detailed measurements in the Hanford plant effluent mixing zone are described. Concentrations of radionuclides in invertebrate organisms of the river decreased by one or two orders of magnitude during a plant shutdown. A number of reports directly related to this program are itemized in a section of this report. (Upadhyaya-Vanderbilt)

EFFECTS OF THERMAL DISCHARGES ON THE MASS ENERGY BALANCE OF LAKE MICHIGAN,
Argonne National Lab., Ill.
J. G. Asbury.
July 1970. 24 p, 27 ref. ANL/ES-1.

Descriptors: *Thermal pollution, *Temperature, Evaporation, *Lake Michigan, *Energy budget, Water balance, Water pollution effects, Lakes.
Identifiers: Thermal discharges, Wind speeds, Exchange coefficients, Advective input.

This report analyzes the impact of man-made thermal discharges on the mass-energy balance of Lake Michigan. The analytical method used is a generalized version of the heat-exchange model developed by Edinger and Geyer for small lakes and cooling ponds. The generalized model should be applicable to large bodies of water. Land-based meteorological data input to the model are corrected for systematic lake-land variation. The lake-wide physical effects of thermal discharges into Lake Michigan are negligible and will continue to be so for the rest of this century. The calculated annual average increase in Lake Michigan water-surface temperature is 1.4..0.4x10 to the minus 3 F per gigawatt of advective input. The associated increase in evaporation water loss is 9..2 cfs per gigawatt input. The model has also been applied to Lake Superior, Horon, Erie, and Ontario. For each of these lakes, the increases in surface temperature are of the same order as for Lake Michigan. (Upadhyaya-Vanderbilt)

MAXIMUM ALLOWABLE CONCENTRATIONS OF MERCURY COMPOUNDS.
Karolinska Institutet, Stockholm (Sweden).

Arch Environ Health, Vol 19, Dec, 1969, p 891-905. 99 ref.

Descriptors: Metals, *Heavy metals, *Toxicity, Standards, Water pollution effects, Human pathology, Epidemiology, Path of pollutants, Diseases, Air pollution.
Identifiers: Maximum allowable concentrations, Human contamination, *Mercury, Mercury pollution.

The report of an International Committee is presented. Permissible limits for mercury are not the same in different countries. They are 0.1 mg/cu m for metallic vapor and inorganic compounds and 0.01 mg/cu m for organic mercury compounds in USA while in USSR, the permissible limits have been stated to be 0.01 mg/cu m for inorganic mercury and 0.005 mg/cu m for alkyl mercury compounds. The deposition of mercury compounds is stated. The article deals further with experimental aspects (absorption, biotransformation and transport, tissue distribution and retention, clinical aspects, chronic exposure, relation between exposure and symptoms, urine mercury, blood mercury, and biochemical changes as an indication of mercury exposure) of inorganic and organic mercury. The toxicity of particular compounds is variable and from this point of view the following categorization is recommended: (1) methyl and ethyl mercury salts, (2) mercury vapor, and (3) inorganic mercury salts. MAC for the three groups

are recommended to be: group (1) 10 microgram Hg/100 ml of blood, group (2) 0.05 mg/cu m, and group (3) 0.01 mg Hg/cu m. (Novotny-Vanderbilt)

CADMIUM POLLUTION IN PERSPECTIVE,
Institute of Public Health, Tokyo (Japan).
Noboru Yamagata, and Itsuzo Shigematsu.
International Symposium on Hydrogeochemistry and Biogeochemistry, September 7-12, 1970, Tokyo, Japan, Preprint. 39 p, 41 ref, 22 tab, 9 fig.

Descriptors: *Metals, Water pollution, *Diseases, Epidemiology, Water quality, Water properties, Water analysis, Polarographic analysis, Spectrophotometry, Toxicity, Human pathology, Water pollution effects, *Heavy metals.
Identifiers: *Cadmium pollution, Mines, Industrial lakes, Chemical vanes.

A brief history of scientific investigations since the manifestation of cadmium poisoning disease up to date is described. Background information on the geochemistry and analytical chemistry of cadmium and the results of surveillances conducted in several districts are given. Characteristic symptoms of 'itai-itai' are listed. Cadmium can be analytically measured by the emission spectrography, polarography, neutron activation analysis, colorimetry, atomic absorption spectrometry. The most sensitive is the atomic absorption. In Japan, it was estimated that man consumes normally 60 micrograms of cadmium/day but in the area of occurrence of 'itai-itai' disease the consumption was more than 600 micrograms/day. The main contributor of the cadmium is foodstuffs, of which above, a half is contributed by rice. (Novotny-Vanderbilt)

PUBLIC OPPOSITION TO NUCLEAR POWER - AN INDUSTRY OVERVIEW,
Atomic Industrial Forum, Inc., New York; and Niagra Mohawk Power Corp., Syracuse, N.Y.
H. G. Slater.
International Atomic Energy Agency Symposium on Environmental Aspects of Nuclear Power Stations, New York, Preprint SM-146/40, August 10-14, 1970, p 15.

Descriptors: *Nuclear powerplants, *Thermal pollution, Environment, Technology.
Identifiers: *Public opinion, Distrust, Polls, Opposition, Controversy.

The public is demonstrating an intense concern for its environment. Most polls on the subject also indicate that the public is by no means as opposed to nuclear power as some critics would have us believe. As recently as five years ago only eight nuclear power reactors had been built in the United States while today there are more than 100 in operation, under construction or on order, representing a total capital investment of $15 billion. Even if more of the public and the press begin recognizing the environment advantages of nuclear power, the controversy around this technology is not likely to disappear, or even diminish. In the press, in much conservationist literature, even in material from some government agencies, the words thermal pollution are invariably linked with the phrase nuclear power. All power plants contributed to the thermal load; present day nuclear plants about 1/3 more than fossil-fueled plants. A major factor in the criticism of the nuclear community is te public's general distrust of the establishment and its credibility. (Upadhyaya-Vanderbilt)

THERMAL WATER HORTICULTURAL DEMONSTRATION PROJECT,
Eugene Water and Electric Board, Oreg; and Vitro, Eugene, Oreg.
Dale E. Bartholomew, Robert W. Bennett, William L. Cole, Rex E. Heide, and James B. O'brien.
1969 Annual Report, February 1970, p 49. 43 fig, 21 tab, 13 ref.

Descriptors: *Thermal water, *Irrigation systems, *Crops, *Frost protection, Experimental farms, Meteorology, Temperature, Humidity, Weather data, Heated water, Water pollution effects.
Identifiers: *Plant cooling, O'brien Farm, Patrick Farm, Heide Farm, Puustinen Farm, Bartholomew/Cole Farm, Bennett Farm.

This project demonstrates how properly managed thermal water from an industrial source can be used advantageously for agricultural irrigation and then returned to its natural source at acceptable temperature levels. The effects of warm water application on crops and attempts to regulate their micro environment are being managed and demonstrated primarily on frost protection, plant cooling and irrigation. It is concluded that thermal energy in warm effluent water can be dissipated by spraying directly to the atmosphere in an agricultural setting. With this dissipation, there was negligible fogging or mist drift to nearby residential areas. Also, the artificially induced warm, moist microclimate on the project did not cause any increase in fungal bacterial problems nor increase the insect infestation. Accidental leaks in the system caused limited flooding of a small area with water at 125F to 130F. Ponding of waters at these temperatures is harmful to bean, peach, apple and nut crops. Soil heating was shown to be beneficial. (Herrera-Vanderbilt)

ENGINEERING SAFETY FACTORS AND THEIR INFLUENCE ON SITING PRACTICES FOR NUCLEAR POWER PLANTS IN THE EUROPEAN COMMUNITIES,
Council of the European Communities, Brussels (Belgium). Industrial Affairs.
W. F. Vinck, H. A. Maurer, and L. Leonardini.
The International Atomic Energy Agency Symposium on Environmental Aspects of Nuclear powerplants, New York, August 10-14, 1970, Typescript. 40 p, 4 tab.

Descriptors: *Sites, *Cooling water, *Safety, Standards, *Thermal pollution, Ecology, Temperature, Accidents, *Nuclear powerplants, Environmental effects.
Identifiers: Oxygen content, Pressure vessel, Core cooling systems, Europe.

The environmental aspects of nuclear powerplants are first of all determined by the conditions of the site, but also by the design and operational conditions of the plant. In general, a site is decided upon by the utility, economic incentives such as load centres and transmission lines and on the basis of technico-economical considerations such as long term provisions for cooling water. A tendency to set even more strict radiological standards, which can be debated, would not affect significantly the development of nuclear power but does also not add to the protection of the public in a significant manner. Recommendations that specify upper temperature limits as well as minimum oxygen content for discharged cooling water, differ from one country to the other within the European community because of differences in local environmental conditions and of incidental discrepencies in regulations. Within the European community, design and engineering for nuclear power comply with the particular site and environmental conditions with which one is confronted. (Upadhyaya-Vanderbilt)

WASTE HEAT AND THE WATER ENVIRONMENT,
Gulf South Research Inst., New Iberia, La.
Julian Hemens.
Chemical Engineering Progress, Symposium Series, Vol 65 (1968) No 97, p 47-50. 4 ref.

Descriptors: *Standards, *Fish, *Thermal pollution, Water quality, Temperature, Thermal power plants, Water pollution effects, Aquatic plants, Aquatic life, Cooling, Cooling water.
Identifiers: Thermal pollution effects, Temperature effects, *Waste heat.

A discussion on temperature standards is present in this paper. The influence of temperature chemical reactions taking place in waters can a determine the role of metabolism and activity of aquatic organisms. Most of the attention has be focused on sports and commercial fish. The medi tolerance value (TLm) of some species has be determined. The data on the other organisms th fish are not so detailed. Recommendation rega ing temperature restrictions is presented. Grow of some species can take place at temperatures high as 39C. Breeding seasons above 26.7C a likely to impair spawning and egg developme For most cold water species the requirement about 11C. (Novotny-Vanderbilt)

POWER STATION SITE SELECTION IN E GLAND AND WALES,
Central Electricity Generating Board, London (E gland).
F. R. Hunt.
International Atomic Energy Agency Symposiu on Environmental Aspects of Nuclear Pow Plants, New York, August 10-14, 1970. Prepri SM-146/35. 15 p, 4 fig.

Descriptors: *Thermal pollution, *Powerplant *Sites, *Cooling water, Radioisotopes, Economic Environment, Water pollution effects.
Identifiers: Gaseous wastes, Public opinion.

Over the 15 year period from 1961 to 197 generating plant capacity in England and Wal will have been increased from 27000 MW to 6700 MW. Probably the most difficult problems cu rently facing power station planners in England an Wales are the visual impact on nearby urban area of groups of cooling towers and the vapour plume emitted from them which can be persistent at time of high atmospheric humidity and the creation c confidence on the part of licensing authority an public in near urban siting of nuclear stations. Th main factors taken into account in the technica and economic evaluation of power station sites ar fuel supply and delivery, cooling water, site are levels and foundation conditions, transmissio lines, access for construction, ash disposal, aircra obstruction and nuclear safety. The biological an chemical consequences of discharging warme water have been extensively studied by the CEGI and ecological research carried out by them over period of many years has confirmed that adverse thermal effects from power stations are virtuall non-existent. (Upadhyaya-Vanderbilt)

THERMAL EFFECTS STUDIES FOR PALISADES NUCLEAR PLANT,
Consumers Power Co., Jackson, Mich.
John Z. Reynolds, and Kenneth A. Swarts.
Transactions of the American Nuclear Society Vo 13, No 1, p 233, July 1970.

Descriptors: *Thermal pollution, *Aquatic life Benthos, Plankton, Periphyton, Fish, Lake Michigan, Eutrophication, Nuclear powerplants. Water pollution effects.
Identifiers: Sampling methods, Palisades nuclear plant.

A brief summary of surveys of Lake Michigan aquatic ecology near the Palisades Nuclear Plant is presented. Data from two years of preoperational surveys will be available for correlation with conditions observed after the plant has been operating. Extent of surveys and sample methods are described. The biological studies are concentrated on the benthos, plankton, periphyton and fish. (Jones-Vanderbilt)

E WEST FALMOUTH OIL SPILL-PER-TENCE OF THE POLLUTION EIGHT NTHS AFTER THE ACCIDENT,
ods Hole Oceanographic Institution, Mass.
mer M. Sass, J. G. Souza, H. L. Sanders, and J. Grassle.
ilable from NTIS as AD-713 947, $3.00 in er copy, $0.95 in microfiche. Technical Report, erence No 70-44, Sept 1970. 32 p, 18 fig, 3 tab, f. FWQA Grant 18050-EBN.
tifiers: *Water pollution, *Oils, *Shellfish, er pollution, *Marine biology, Bays, Toxicity, sachusetts, Pelecypoda, *Buzzards Bay, ater pollution damage, Sediments, Biodeteri-ion.

ill of 650,000-700,000 liters of no 2 fuel oil has taminated the coastal areas of Buzzards Bay, s.The present report summarizes the results of continuing chemical and biological study which e available at the end of May 1970, more than t months after the accident. The effects of en-nmental exposure on the composition of the oil liscussed; many analytical parameters are suffi-tly stable to permit continued correlation of oil remaining in sediments and organisms with uel oil involved in the spill.Oil from the spill is present in the sediments, inshore and offshore in the shellfish. A further spread of the pollu-to more distant offshore regions has occurred ng mid-winter; as a result, the pollution now rs a much larger area than immediately after accident. The first stages of biological sumably bacterial) degradation of the oil are evident especially in the least polluted regions; ever, it has depleted predominantly the straight branched chain alkanes.The more toxic aro-c hydrocarbons are resistant; as a result, the ity of the oil has not been diminished. Where an be detected in the sediments there has been of animals; in the most polluted areas the kill been almost total. Shellfish that survived the lent have taken up the fuel oil. The 1970 crop ellfish is as heavily polluted as was last year's Oysters transplanted to unpolluted water for ng as 6 months retained the oil without chance mposition or concentration.

ifiers: *Mixed cultures, Dieoff rates, After-h.

us enteric organisms were exposed to axenic res of green and blue-green algae to determine effect the algae might have. Tests were ex-d to 90 days to determine whether after-h was possible. Mixed cultures of both green lue-green algae were exposed to both single es and mixed cultures of enteric bacteria, at ng stages of the algae growth periods. Results ated that mixed cultures do have a unced bactericidal effect on enteric organ-isms, while for single algal species, the effect is less pronounced. Also, the bactericidal effects are more specific for pathogens, with virtually no after-growth of pathogens detected. (Lowry-Texas)

ACUTE TOXICITY OF LAS TO VARIOUS FISH SPECIES,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Cincinnati Water Research Lab.
Thomas O. Thatcher, and Joseph F. Santner.
Proceedings Industrial Waste Conference, 21st, March 1966, Purdue University, Vol L, No 2, March 1966, Part II, p 996-1002. 1 fig, 4 tab, 9 ref.

Descriptors: *Toxicity, *Fishkill, Mortality, Water pollution effects, *Linear alkylate sulfonates, *Alkylbenzene sulfonates, *Detergents, Aquatic life.

Tests with LAS products were conducted during 1965 on five species of fish to determine the toxicity of this compound to aquatic life. A comparison of LAS values versus ABS values obtained in a previous test, indicated that LAS is 2-4 times as toxic to fish as is ABS. The data from this test demonstrates that sufficient difference in sensitivity to LAS exists among species of fish to warrant attention to this factor when assessing the potential hazard of LAS to aquatic populations. (Ellis-Texas)

CAUSES OF OYSTER SPAT MORTALITY, CONDITIONS OF OYSTER SETTING BEDS, AND RECOMMENDATIONS FOR OYSTER BED MANAGEMENT,
Bureau of Commercial Fisheries, Milford, Conn. Biological Lab.
Clyde L. MacKenzie, Jr.
National Shellfisheries Association, 1969 Proceedings, Vol 60, p 59-67, June 1970. 4 tab, 16 ref.

Descriptors: *Oysters, *Silts, Water pollution sources, Mortality, Fouling, *Predation, Commercial shellfish.
Identifiers: *Mechanical breakage, *Suffocation, *Starvation, Bryozoan poisoning, *Crassostrea virginica, American oyster, *Spot mortality, Starfish, Oyster drills.

The causes of oyster spat mortality conditions of oyster setting beds and recommendations for oyster bed management are described. As part of a study of mortalities of American oysters, Crassostrea virginica. The causes were identified of mortality of oyster spat between setting and age of 6 months and their relative importance was compared. The causes were complex and varied widely from bed to bed. They were a result of predation by various species, overgrowth by others, mechanical breakage during transplanting, suffocation by silt, early post-setting mortality (cause unknown), and deaths apparently from starvation and, in one location, from poisoning by a bryozoan. Two factors prevented much larger sets of oysters on commercial beds: (1) a small supply of clean oyster shells available for commercial oyster companies to plant and (2) layers of fouling organisms and silt that accumulate on shells planted for any length of time. (Wahtola-Washington)

A COMPARISON OF THE TOXICITY OF SOME COMMON INDUSTRIAL WASTE COMPONENTS TESTED INDIVIDUALLY AND COMBINED,
Kansas Univ., Lawrence; and Academy of Natural Sciences, Philadelphia, Pa.
John Cairns, Jr., and Arthur Scheier.
The Progressive Fish-Culturist, Vol 30, No 1, p 3-8, January 1968. 3 tab, 8 ref. US Public Health Service Grants RRG-3965 and EF00266.

Descriptors: *Waste disposal, *Industrial wastes, *Bioassay, Toxicity, Temperature, Water pollution effects, *Sunfish, *Water quality control, Chemical wastes, Mortality, Lethal limit, Chromium, Copper.
Identifiers: *Synergistic effects, *Acetic acid, *Acetaldehyde, *Acetone, *Naphthenic acids, Potassium cyanide, Zinc.

A comparison of the toxicity of some common industrial waste components were tested. These components were tested individually and combined. It is known that components of an effluent may interact so that their collective toxic effect on aquatic organisms can substantially differ from their individual toxicities. They were divided into three categories; additive, antagonistic, or synergistic. No dramatic interaction between the various components of the mixtures tested was evident. Support was found for the practice of segregating certain waste components for intensive treatment before disposal or compositing other wastes. (McConnell-Washington)
W71-05205

CHRONIC EFFECTS OF METHOXYLCHLOR ON BLUEGILLS AND AQUATIC INVERTEBRATES,
Bureau of Sport Fisheries and Wildlife, Columbia, Mo. Fish-Pesticide Research Lab.
Harry K. Kennedy, Lafayette L.Eller, and David F. Walsh.
Technical Papers of the Bureau of Sport Fisheries and Wildlife, No 53, March 1970. 18 p, 6 fig, 35 ref, 8 tab.

Descriptors: *Insecticides, Aquatic animals, Pathology, Persistence, Juvenile fishes, *Halogenated pesticides, Chlorinated hydrocarbon pesticides, *Sunfishes, Bioassay, *Water pollution effects, Mortality, Fish physiology, Fish reproduction, Pesticide residues, Diptera, DDT.
Identifiers: *Methoxychlor, Baetidae, Heptageniidae, Coenagrionidae, Physidae.

The chronic effects of methoxychlor on bluegills and various aquatic invertebrates is described. Bluegills (average weight 7 grams, average fork length 73 mm) were exposed to methoxychlor at concentrations of 0, 0.01, and 0.04 ppm in ponds for 13 weeks in late summer. Fish losses were small and not attributable to methoxychlor exposure. There were no significant differences in fish growth in the three pairs of ponds. Pathologic changes occurred in tissues and organs, primarily in livers and circulatory systems. Precipitated materials were observed in major blood vessels of gills and hearts 24 hours after treatment. This material coalesced, became multivacuolated, was conspicuous in most large blood vessels of every organ during the first week after treatment, persisted through day 28, and disappeared by day 56. Methoxychlor uptaken by the fish in 004-ppm-treated ponds was rapid, 21ppm by day 3; the insecticide was stored in whole body tissues through day 28 and metabolized or excreted by day 56. Significantly higher numbers of aquatic insects were sampled in treated ponds than in untreated, and insect numbers at high-treatment ponds were significantly higher than at low-treatment ponds. Chironomids were dominant and significantly increased after the 0.04-ppm treatment. Chironomids comprised 74 percent of samples from high-treatment ponds, but only 43 and 42 percent respectively from untreated and low-treatment ponds. Mayflies of the family Baetidae were less common. (Wahtola-Washington)

FISH AND CRAYFISH MORTALITIES DUE TO AN INTERNAL SEICHE IN GEORGIAN BAY, LAKE HURON,
Department of Lands and Forests, Maple (Ontario). Research Branch.
Alan R.Emery.
Journal of the Fisheries Research Board of Canada, Vol 27, p 1165-1168 1970. 9 ref, 1 tab, 1 fig.

Descriptors: *Thermal pollution, *Fish, *Great Lakes, Behavior, Sculpins, Crayfish, Trout, Perches, *Seiches, Fishkill, Mortality, Turbidity, Light penetration, Temperature.

Identifiers: *Lake Huron, Georgian Bay, *Orconectes.

Fish mortality due to an internal seiche is described. An internal seiche in Georgian Bay, Lake Huron, altered water temperatures and transparency in Little Dunks Bay (a small shallow bay). A sudden decrease in temperature was the probable cause of mortalities in sculpins (Cottus bairdi) and crayfish (Orconectes propinquus) as well as of marked changes in behavior of other fish species. Trout-perch (Percopsis omiscomaycus) appeared unaffected. (Wahtola-Washington)

FISHERY IMPLICATIONS ASSOCIATED WITH PROLONGED TEMPERATURE AND OXYGEN STRATIFICATIONS,
Arizona Cooperative Fishery Unit, Tucson.
Charles D. Ziebell.
Journal of the Arizona Academy of Science, Vol 5, No 4, p 252-262, October 1969. 5 fig, 13 ref.

Descriptors: *Temperature, *Oxygen, *Stratification, Solar radiation, Thermocline, Arizona, Fish behavior, Fish management, Hypolimnion, *Thermal stratification, Fisheries, Fish populations.
Identifiers: Overcrowding, Pena Blanca Lake.

Fishery implications associated with prolonged temperature and oxygen stratification for Pena Blanca Lake, Arizona, are described. The lake is stratified from March through November, which results in severe oxygen depletion in the hypolimnion. Possible overcrowding of mixed fish populations might cause inter-intraspecific competition for food and space. The unique limnology of Southern Arizona lakes cause unusual and challenging problems for fisheries management. (Katz-Washington)
W71-05209

AN ANAESTHETIC FOR COROPHIUM VOLUTATOR (PALLAS) AND MARINOGAMMARUS OBTUSATUS (DAHL), CRUSTACEA, AMPHIPODA,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
J. C. Gamble.
Experientia 25, p 539-540, 1969. 2 tab, 2 fig, 8 ref.

Descriptors: *Amphipoda, Temperature, Fish, *Crustaceans, Sea water, Aquatic animals, Fish physiology.
Identifiers: MS-222, *Anaesthetics, Corophium volutator, Marinogammarus obtusatus.

The experiments showed that MS-222 Sandoz is an effective anaesthetic for marine amphipods, Corophium volutator and Marinogammarus obtusatus. The optimal effective concentration is relatively high (1:2000) when compared with the doses (1:25,000 to 1:12,000) recommended for fishes. The fish, like amphipods, are anaesthetized easily, but take longer to recover after prolonged immersion in the anaesthetic. (Wahtola-Washington)
W71-05210

THE EFFECT OF CHINA CLAY ON THE BOTTOM FAUNA OF ST. AUSTELL AND MEVAGISSEY BAYS,
Ministry of Agriculture, Fisheries and Food, Burnham-on-Crouch (England). Fisheries Lab.
B. R. Howell, and R. G. J. Shelton.
Journal of the Marine Biological Association, Vol 50, p 593-607, 1970. 1 tab, 10 fig, 13 ref.

Descriptors: *Clay, *Deposition (Sediments), Fish, *Water pollution effects, *Benthic fauna, Industrial wastes, *Annelids, *Mollusks, Aquatic animals, Gastropods.
Identifiers: *Echinoidea, *Holothurioidea, China clay, *Ophiuroidea

The deposition of china-clay waste has had a marked effect on the bottom fauna of St. Austell and Mevagissey Bays. Apart from an immediately inshore zone, where the rate of clay deposition is apparently severely limiting, the clay-affected zones support a rich community of deposit-feeding animals. Suspension-feeding forms which are common outside the clay deposits and in an adjoining bay, are largely absent from St. Austell and Mevagissey Bays. The behavior of pelagic fish in water polluted by clay wastes was investigated, but it was noted that fish would avoid the high turbidity. (Wahtola-Washington)

EVALUATING THE EFFECT OF INDUSTRIAL WASTES ON LAGOON BIOTA,
Missouri Univ., Columbia. Dept. of Civil Engineering.
Hardam S. Azad, and Darrell L. King.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, 6, 1965. Purdue University, Vol XLIX, No 3, p 410-422, July 1965. 7 fig, 1 tab, 21 ref.

Descriptors: *Biota, *Lagoons, *Industrial wastes, *Copper, *Chromium, Aquatic life, Respiration, Metabolism, Oxygen requirements, Photosynthesis, Hydrogen ion concentration, *Toxicity, Water pollution effects, Waste water treatment.
Identifiers: Potassium dichromate, Copper sulfate, Warburg.

A method was proposed which can be used to evaluate the shock load toxicity of a particular waste to the biota peculiar to a given lagoon before the waste is introduced to the lagoon. In order to do this the metabolic degradation of domestic wastes was evaluated by at least four different methods and for a wide variety of biotic communities. The impact of copper and chromium on lagoon metabolism was determined by comparing the oxygen demand of the samples subjected to the metals to that of a control containing just lagoon effluent. Copper, fed as copper sulfate, in concentrations greater than 0.20 mg/l was shown to seriously affect the performance of a waste stabilization lagoon while shock loads of hexavalent chromium, fed as potassium dichromate, were shown not to have any appreciable affect on lagoon performance at concentrations up to 40 mg/l. A significant depression of the pH and evolution of a gas appearing to be CO sq accompanies slug doses of Cu greater than 2.0 mg/l and Cr greater than 50 mg/l. (Ellis-Texas)

DISPERSANT TOXICITY TEST PROCEDURES,
Ministry of Agriculture, Fisheries and Food, Burnham-on Crouch (England). Fisheries Lab.
R. G. J. Shelton.
Prevention and Control of Oil Spills, Joint Conference, Proceedings, New York, New York, December 15-17, 1969, Co-sponsored by American Petroleum Institute and U.S. Federal Water Pollution Control Administration, Washington, D.C., American Petroleum Institute Publication No 4040, p 187-191. 7 ref.

Descriptors: *Oil wastes, Water pollution control, Cleaning, Chemicals, *Toxicity, *Aquatic life, *Bioassay, Water pollution effects.
Identifiers: Effectiveness evaluations, *Dispersants, Oil pollution, Coastal pollution.

Toxicity of chemicals to disperse oil is considered in relation to effects on fisheries and marine life. Toxic dispersants should not be used in large quantities in shallow coastal water, over shellfish beds, or fish nursery grounds, or in estuaries. Mechanical methods should be used in these areas and chemical methods used only on high-amenity beaches. Many commercially available dispersants and some experimental formulations have been tested. Oil and dispersants may affect fisheries marketa by adding displeasing flavours to fish and shel (See also W70-10035) (Ensign-PAI)
